

MASTER -
WEEK 2

WEBSITE & ANALYTICS FOUNDATIONS

Turning data into decisions from day one.

oreegami

Week 2 Agenda

Week 2 focuses on Website & Analytics Foundations the toolkit every modern marketer needs to turn digital traffic into measurable business outcomes.

Across this week, learners will build, measure, and optimize a website experience . Moving from structure and UX, into analytics setup, and finally into data-led decisions that drive growth.

Session 1 — Website Architecture, UX & Conversion Essentials

Session 2 — Google Analytics 4 Setup, Tracking & Key Metrics

Session 3 — SEO Foundations & Turning Data Into Decisions

What You'll Achieve

- Build a website that's structured for usability, SEO, and conversion
- Set up Google Analytics 4 with the right properties, data streams, and events
- Track key user journeys, traffic sources, and conversion funnels
- Apply on-page SEO best practices to improve search visibility and rankings
- Read core web metrics — sessions, bounce rate, engagement, and ROI
- Identify high-performing pages and diagnose underperforming ones
- Translate analytics insights into actionable marketing decisions
- Deliver a Week 2 capstone: a data-backed website audit and growth plan

Why Your Website **Matters**

Think of your website as your shop window — open 24/7 to the world.

75%

**of users judge a brand's credibility
based on its website**

First Impression

Visitors decide in seconds whether to stay or leave. Your website is often the first meeting with your brand.

Always Open

Unlike a physical shop, your website never closes. It works while you sleep, take holidays, or focus elsewhere.

Your Silent Salesperson

A good site answers questions, builds trust, and guides people toward booking, buying, or contacting you.

The Three Essentials

Every great website does three things really well — for your visitors and for Google.

01

UX (User Experience)

How easy is it to use? Can people find what they want fast? Clear menus, readable text, and obvious buttons matter most.

02

Page Speed

How fast does it load? If it takes more than 3 seconds, half your visitors leave. Speed equals more customers.

03

Mobile Responsive

Does it look good on a phone? Over 70% of visits come from mobile. Your site must adapt to small screens.

UX (User Experience)

Make every page effortless to use — clear navigation, readable typography, and obvious next steps that guide visitors to action.

01

Navigation & Structure

Logical menus, breadcrumbs, and a clear information hierarchy so visitors find what they need in 3 clicks or less.

02

Visual Hierarchy

Readable type, generous spacing, and strong contrast so the eye lands on what matters — headlines, CTAs, key offers.

03

Friction & Forms

Short forms, helpful error states, and clear button labels reduce drop-offs and lift conversion rate.

Page Speed

Speed is a conversion lever. Every extra second of load time costs visitors, rankings, and revenue.

01

Why It Matters

53% of mobile users leave a page that takes longer than 3 seconds. Google also uses speed as a ranking signal.

02

Core Web Vitals

LCP, INP, and CLS are the three metrics Google measures. Aim for green scores in PageSpeed Insights.

03

Quick Wins

Compress images, lazy-load below-the-fold content, enable caching, and minimize third-party scripts.

Mobile Responsive

Over 70% of traffic now comes from phones. A site that breaks on mobile breaks your business.

01

Responsive Design

Layouts that fluidly adapt to phone, tablet, and desktop — no horizontal scroll, no pinching to read.

02

Touch Targets

Buttons sized for thumbs (minimum 44×44 px), generous tap spacing, and finger-friendly forms.

03

Mobile Performance

Smaller images, fewer scripts, and faster servers because mobile networks are unforgiving.

Good Website vs Bad Website

Train your eye to spot the difference in 10 seconds — these are the signals visitors notice first.

GOOD WEBSITE

- **Fast loading**
Under 3 seconds to first content. Visitors stay and explore deeper.
- **Mobile-friendly**
Buttons big enough to tap. Text readable without zooming.
- **Clear next step**
One obvious action: Buy, Book, or Contact. Decisions feel easy.

NEEDS WORK

- **Slow & heavy**
Loads slowly with huge unoptimised images. Visitors give up.
- **Tiny mobile text**
Cluttered layout, micro buttons, horizontal scroll. Frustrating.
- **Unclear action**
Many competing buttons. Visitors don't know what to do and leave.

Meet GA4

GA4 is Google's free analytics platform. It tells you who visits your website and what they do there.

Replaces Universal Analytics

GA4 replaced the old Universal Analytics in July 2023. It's now the only Google analytics product going forward.

Tracks Events, Not Pages

Every action — clicks, scrolls, video plays, downloads — is captured as an event. Much richer than just page views.

GA4

Free + Powerful

Works Across Web + App

One property tracks both your website and your mobile app together. See the full customer journey in one place.

Setting Up GA4

Getting started is free and takes about 15 minutes — no developer needed for the basic setup.

1

STEP 1

Create an Account

Visit **analytics.google.com** and sign in with any Google account. Click Admin then Create Property.

2

STEP 2

Grab Your Tracking ID

GA4 gives you a small code snippet, called the Measurement ID (starts with G-). This is your tracker.

3

STEP 3

Install on Your Site

Paste the code into your website's header. Or use a plugin if you use WordPress, Shopify, or Wix.

4

STEP 4

Verify It Works

Open Realtime in GA4 and visit your own site. See yourself appear within 30 seconds — done.

The 4 Metrics That **Matter Most**

Understand these four numbers and you understand how visitors actually behave on your site.

Users

Unique visitors to your site over a given period. GA4 counts each person once based on a device identifier, no matter how many times they return.

Sessions

A single visit — every time a user lands on your site and engages. Sessions reset after 30 minutes of inactivity or at midnight.

Engagement Rate

Percentage of sessions that lasted 10+ seconds, fired a conversion, or had 2+ page views. The new GA4 quality signal that replaces bounce rate.

Conversion Events

User actions that matter to your business — form submits, purchases, signups. Mark them as conversions to track ROI accurately.

GA4 Interface Tour

Once data is flowing, you will spend most of your time in these four sections.

01

Home

Your dashboard. Top numbers at a glance — users today, traffic sources, and quick trends. Start here every morning.

02

Reports

Pre-built views: who your users are, where they come from, what they do on your site. The bread and butter.

03

Explore

Build your own custom reports by dragging metrics. More flexible, slightly more advanced — for digging deeper.

The Metrics That **Actually Matter**

GA4 has hundreds of numbers. Focus on these three to understand your website's health.

01

Users

How many different people visited? Unique humans, not page reloads. The headline number of audience size.

02

Sessions

How many visits in total? One user can have multiple sessions in a week. Shows return-visit behaviour.

03

Engagement Rate

Percent of visits that were meaningful — stayed 10+ seconds, viewed multiple pages, or converted.

Conversion **Events**

A conversion is any action you actually care about — a sale, signup, phone click, or form submission.

Lead Conversions

Newsletter signups, contact form submissions, demo bookings, brochure downloads — anything that becomes a sales opportunity.

Sale Conversions

Online purchases, subscriptions, upsells. Tied directly to revenue. Easy to prove marketing ROI.

KEY EVENTS

You decide

Micro-Conversions

Smaller actions like video watches, scroll depth, or pricing-page visits — early signals of interest.

Reading Reports

A quick example: how to read a GA4 report and turn the numbers into an actual decision.

5%

**conversion rate — 8 conversions from
150 sessions**

The Numbers

100 users, 150 sessions, 65% engagement, 8 conversions. What does it actually mean for your business?

The Insight

Each user visited 1.5 times on average. About 35 sessions bounced before doing anything meaningful.

The Decision

5% conversion is decent. To grow, focus on those 35 bouncing sessions — likely a landing-page or speed issue.

What's a Funnel?

A funnel is the journey from first visit to final purchase — usually shaped like a triangle that narrows down.

- **Awareness**

People who just discover you — they read a blog, see an ad, land on your homepage. Big group, low intent.

- **Interest**

Curious now — they browse, sign up for emails, compare options. Warmer interest.

- **Consideration**

Comparing you to alternatives — they read reviews, check pricing, ask questions.

- **Conversion**

Ready to buy — add to cart, request demo, fill the form. Small group, high value.

Who Gets Credit?

Attribution answers: when someone buys, which marketing channel deserves credit for the sale?

01

First-Click

All credit goes to the very first touchpoint. Honours discovery but ignores everything that followed.

02

Last-Click

All credit to the last touch before purchase. Simple but unfair to brand-building channels.

03

Data-Driven (GA4)

GA4's AI shares credit across every touchpoint based on real influence. The modern, fairer approach.

A Customer's Journey

Let's trace one real path from stranger to buyer — and see what each step teaches you.

What is GTM?

Google Tag Manager (GTM) lets you add tracking codes to your website without touching the code yourself.

1

container holds every tracking tag on your site

The Problem

Every tool — GA4, Facebook Pixel, LinkedIn Insight — needs its own code snippet. Adding them all is messy and risky.

The Solution

GTM is a single container that holds all your tags. Install once, manage everything from a friendly dashboard.

Who It's For

Marketers who want control without depending on a developer for every small tracking change.

How GTM Works

GTM uses three simple building blocks. Once you know them, you can track almost anything on your site.

Tags

The actual tracking code — e.g., the GA4 tag or a Facebook Pixel. Each tag does one job. Think of them as workers.

Triggers

When the tag should fire — e.g., 'when someone clicks Buy' or 'when a form is submitted'. The 'when' rules.

Variables

Extra info to capture — page URL, button text, purchase value. The 'what' data your tags collect.

Why GTM **Saves Time**

A real example: how GTM turns a 2-week developer ticket into a 5-minute marketing task.

WITHOUT GTM

- **Ask a Developer**
You want to track a button click. You file a ticket. It sits in a backlog.
- **Wait & Deploy**
Developer adds code, tests, schedules a release. One to two weeks gone.
- **Repeat Forever**
Every tiny tweak needs the same long process. Marketing momentum dies.

WITH GTM

- **Open GTM**
Log in. Click 'New Tag'. Pick GA4 from the template list. Two clicks done.
- **Add a Trigger**
Choose 'Click — All Elements'. Set the button class or ID. Connect to the tag.
- **Preview & Publish**
Test in Preview mode. Hit Submit. Live in 5 minutes. Iterate freely.

What's a **Conversion**?

A conversion is any visitor action that's valuable to your business. You decide what counts.

01

Common Examples

Purchase, sign-up, form submission, phone click, PDF download, video watch, demo booking — the list is your call.

02

Why It Matters

Conversions are the bridge between marketing activity and business results. They prove what actually works.

03

Start Small

Pick one or two main conversions to begin. Trying to track everything from day one usually causes confusion.

Goals, Events, **E-commerce**

Three different tracking types in GA4. Use the one that fits your business model.

01

Goals (Key Events)

For lead-based businesses. Track sign-ups, form fills, contact clicks. Free and simple to set up.

02

Custom Events

Track specific behaviour — video plays, scroll depth, button clicks. Useful for engagement insights.

03

E-commerce Tracking

For online shops. Tracks product views, add-to-cart, checkout, purchase value, and refunds.

Setting It Up

Three steps to turn a visitor action into a measured conversion.

1

STEP 1

Define the Action

Be specific: 'clicked the Book Now button on the pricing page'. Vague tracking gives vague reports.

2

STEP 2

Build the Event

Use GTM or GA4 Admin to create the event. Give it a clear, snake_case name like 'book_demo_click'.

3

STEP 3

Mark as Key Event

In GA4, toggle the event to 'Mark as key event'. Now it appears in conversion reports automatically.

What is **Looker Studio**?

Looker Studio (formerly Data Studio) turns numbers into beautiful, shareable dashboards. Free.

800+

**data connectors — GA4, Ads, Sheets,
YouTube and more**

Free & Visual

Drag-and-drop interface. No coding required. Build charts, tables, and scorecards in minutes.

Connects Everything

Pulls live data from GA4, Google Ads, Sheets, YouTube, and hundreds of other tools — all in one place.

Easy to Share

Send a link. Your team, boss, or client can view the dashboard anytime. Always up to date.

Connecting Your Data

Before you build a dashboard, you connect Looker Studio to where your numbers actually live.

1

STEP 1

Pick a Data Source

Click Add Data. Choose GA4, Google Ads, Sheets, or any of 800+ connectors. Sign in to authorise.

2

STEP 2

Choose Your Fields

Decide which metrics and dimensions you want — Users, Sessions, Source, Country, Device, and more.

3

STEP 3

Watch It Refresh

Looker Studio pulls fresh data every time the report loads. No exporting CSVs ever again.

Your First Report

A simple, useful dashboard you can build in under an hour — and impress your team with.

01

The Scorecard

Big-number scorecards at the top: Users, Sessions, Conversions, Conversion Rate. Your quick health check.

02

The Trend Chart

A line chart of users over time. Spot growth, dips, and weekly patterns at a glance.

03

The Source Table

Breakdown of traffic by source (Google, Facebook, Direct). Shows which channels actually deliver.

Why Clean Data Matters

Bad data leads to bad decisions. A few minutes of hygiene saves hours of confusion later.

30%

of business decisions are made from
inaccurate data

Garbage In, Garbage Out

If tracking is wrong, reports are wrong. Decisions from bad data waste real money.

Trust Your Numbers

Clean data builds confidence. You can act fast because the dashboard is actually telling the truth.

Easier Audits

When something looks off, clean setups are easy to debug. Messy setups take days to untangle.

Common Mistakes

The most frequent tracking errors — and exactly how to avoid each one.

WATCH OUT

- **Counting Yourself**
Forgetting to filter your own IP, agency, or staff visits. Inflates traffic and ruins rates.
- **Double-Tagging**
GA4 installed directly AND via GTM. Every event fires twice. Reports look great until you check the truth.
- **Bot Traffic**
Spam bots inflate page views and skew sources. They sneak in if you don't filter.

DO THIS INSTEAD

- **Add an IP Filter**
Use Admin → Data Streams → Configure tag → Internal Traffic. Add your office IP. Done.
- **Choose One Method**
Install GA4 either directly OR through GTM, never both. Audit your site for duplicate tags.
- **Enable Bot Filtering**
In GA4 Admin, Bot Filtering is on by default. Confirm it. Review traffic sources monthly.

Your Hygiene Checklist

Run through this list once a month to keep your data trustworthy and audit-ready.

Check Your Sources

Open Acquisition reports. Do the channels make sense? Any suspicious '(not set)' or unknown referrers?

Test Your Conversions

Submit your own form, click your own button. Does GA4 record it within 30 seconds? If not, fix the event.

Filter Internal Traffic

Add an Internal Traffic filter for your office IP, your team, your developers. Keeps reports clean.

Review Bot Filtering

Confirm bot filtering is enabled. Spot-check unusual spikes in 'Direct / (none)' traffic.

GA4 Demo Account

Practise without risk. Google's demo account gives you real data from the Merchandise Store — perfect for learning.

01

Why a Demo

You don't need your own site to learn GA4. The demo has months of real traffic and conversions to explore.

02

How to Access

Go to support.google.com/analytics/answer/636734
2. Click 'Access demo account'. Free and instant.

03

What You Get

Live GA4 property with millions of events. Browse reports, build funnels, try Explore — no setup needed.

Navigating Key Reports

Once you're inside the demo, follow this path to learn the most useful views in 15 minutes.

1

STEP 1

Open Acquisition

See where visitors come from. Spot the top traffic sources and the channels that drive conversions.

2

STEP 2

Open Engagement

Find your most-viewed pages. Understand which content keeps people interested and which falls flat.

3

STEP 3

Open Monetization

See actual purchases. Learn what e-commerce data looks like when tracking is set up correctly.

Your First **Insights**

Three questions to answer using the demo account. Capture your findings in your workbook.

Top Channel

Which traffic source brings the most users? Which brings the most conversions? Are they the same channel?

Best Page

Which page has the highest engagement rate? What can you learn about content that performs well?

Buyer Drop-Off

Use Explore → Funnel. Trace from product view to purchase. Where do most users drop off in the flow?

Build a Marketing Report

Create a 1-page Looker Studio dashboard with 5 essential marketing KPIs your team will actually use.

01

KPI 1: Total Users

How many people visited this month?
Compare to last month for trend. Headline number.

02

KPI 2: Sessions

How many visits in total? Higher than users means returning visitors — a healthy sign.

03

KPI 3: Conversion Rate

Percent of sessions that converted. Your efficiency at turning visits into business outcomes.

Visualise & Connect

Turn raw GA4 numbers into clear visuals your boss or client can actually read at a glance.

1

STEP 1

Add Source

In Looker Studio click 'Add data' → 'Google Analytics' → choose your demo property.
Done in 30 seconds.

2

STEP 2

Build KPI 4

Add a pie or bar chart of traffic sources.
Instantly shows where your users come from.

3

STEP 3

Build KPI 5

Add a time-series line for Engagement Rate.
Reveals whether your content gets better over time.

Share With Your Team

A dashboard nobody sees is wasted work. Make yours easy to find, trust, and act on.

Add a Clear Title

Name the report — e.g., 'Monthly Marketing KPIs — June 2026'. A date stamp builds trust.

Click Share

Top-right Share button. Set permissions (view-only is usually right). Copy the link.

Distribute the Link

Email it, drop in Slack, pin in the team wiki. Set yourself a monthly refresh reminder.

Set Up Your GTM Container

A GTM container is your home base for all tracking. Setting one up takes just 5 minutes.

1

STEP 1

Create Account

Go to tagmanager.google.com. Click 'Create Account'. Name it after your business.

2

STEP 2

Create Container

Pick 'Web' as the target platform. GTM generates a unique container ID (starts with GTM-).

3

STEP 3

Install the Snippet

Copy the two GTM code snippets. Paste them into your website's head and body. Done.

Build 3 Basic Triggers

Triggers tell tags when to fire. Start with these three — they cover most common marketing use cases.

Page View

Fires on every page load. Standard for the main GA4 tag. The simplest trigger to build first.

Button Click

Fires when someone clicks a specific button — e.g., 'Buy Now'. Use Click Classes or Click ID.

3 TRIGGERS
to start with

Form Submit

Fires when a contact form is submitted. Captures real leads. Always test it with your own form first.

Test & Publish

Never publish blindly. GTM has a built-in preview mode that shows what's firing in real time.

1

STEP 1

Click Preview

Top-right Preview button. Enter your site URL. A debug panel opens showing every tag and trigger.

2

STEP 2

Trigger Each One

Load the page, click the button, submit the form. Confirm each tag fires with the right data.

3

STEP 3

Click Submit

When everything looks right, hit Submit. Add a version name and description. Now it's live.

What's a Bottleneck?

A bottleneck is the step in your funnel where most people drop off. Find it, fix it, conversions jump.

- **Visits**
Everyone who lands on your site. The starting universe of potential customers.
- **Add to Cart**
Visitors who added a product to their cart. Real intent signal.
- **Checkout**
Made it to the checkout page. Almost there — but here is where most drop off.
- **Purchase**
Completed the transaction. The number that actually pays the bills.

Read the **Sample Data**

Practise on the GA4 demo dataset. Walk through these steps to spot a bottleneck yourself.

Spot & Solve

Three common bottleneck causes — and the proven fixes that lift conversions fast.

THE PROBLEM

- **Slow Checkout Page**
Page takes 6+ seconds to load. Mobile users especially abandon.
- **Surprise Costs**
Shipping fees appear only at checkout. Sticker shock kills the sale.
- **Form Friction**
Too many fields. Required phone number. No autofill. Users give up.

THE FIX

- **Optimise Speed**
Compress images. Remove heavy scripts. Aim for under 3 seconds on mobile.
- **Show Total Early**
Display full price including shipping on the product page. No surprises.
- **Trim the Form**
Drop optional fields. Add autofill. Each removed field can lift conversions 5–10%.

Week 2 Summary

Everything we covered this week — from website essentials to GA4 analytics and SEO foundations.

01 ———

Website Foundations

The 3 essentials: UX, page speed, and mobile responsiveness

02 ———

UX in Depth

Navigation, visual hierarchy, and friction-free forms

03 ———

Page Speed

Core Web Vitals — LCP, INP, CLS — and conversion lift

04 ———

Mobile Responsive

Touch targets, responsive design, and mobile performance

05 ———

Google Analytics 4

Properties, data streams, and event tracking setup

06 ———

Key GA4 Metrics

Users, sessions, engagement rate, and conversion events

07 ———

SEO Foundations

On-page best practices to improve search visibility

08 ———

Reading the Data

Traffic sources, user journeys, and conversion funnels

09 ———

Week 2 Capstone

A data-backed website audit and growth plan

Thanks
