27 Ethics and disclosure
28 Case study: a cake shop
29 Exercises and Prompt Toolkit
30 Checklists and glossary

PART A

Foundations

What AI is, how language models work, why they make mistakes and which assistants to use

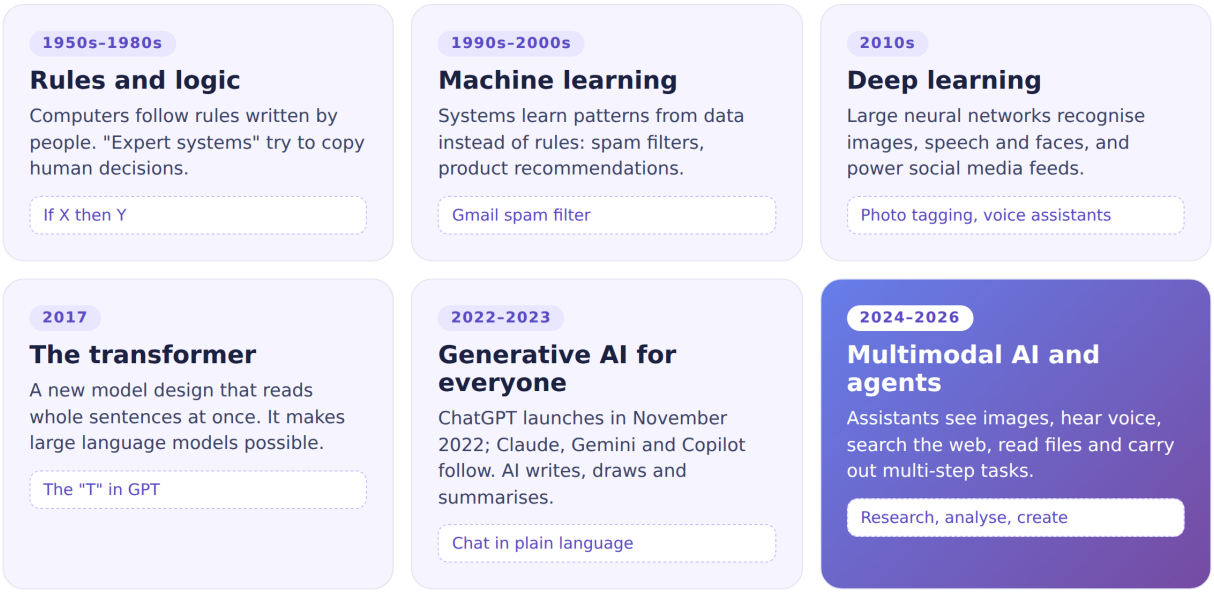

SECTION 1

AI in marketing: from science fiction to daily tool

AI (Artificial Intelligence) means computer systems that do tasks which normally need human intelligence: understanding language, recognising images, making predictions or creating content. You have used AI for years without noticing it: in your Gmail spam filter, in Google Maps traffic times and in every Facebook or TikTok feed.

How we got here: a short history of AI

Seventy years of ideas, and a very fast last five

Why this week matters

Since the launch of ChatGPT in November 2022, generative AI has moved from a curiosity to a normal work tool. Marketers now use it every day to research, plan, write, design, translate and analyse. In Weeks 3 to 10 you already met AI inside Google Search, social feeds, Google Ads, Meta Ads and email tools. This week you learn to use AI assistants **directly**, as a creative and analytical partner.

Week	What you learn about AI
Week 13 (this week)	AI fundamentals, assistants, prompting, content creation, quality control and ethics
Week 14	AI in paid media and automation: AI-powered campaigns, bidding, creative testing and integrations
Week 15	Marketing automation and lead nurturing (Zapier, Make, Manychat)

What AI changes, and what it does not

- **Speed:** a first draft of a blog outline, ten ad headlines or a summary of 200 reviews now takes seconds instead of hours.

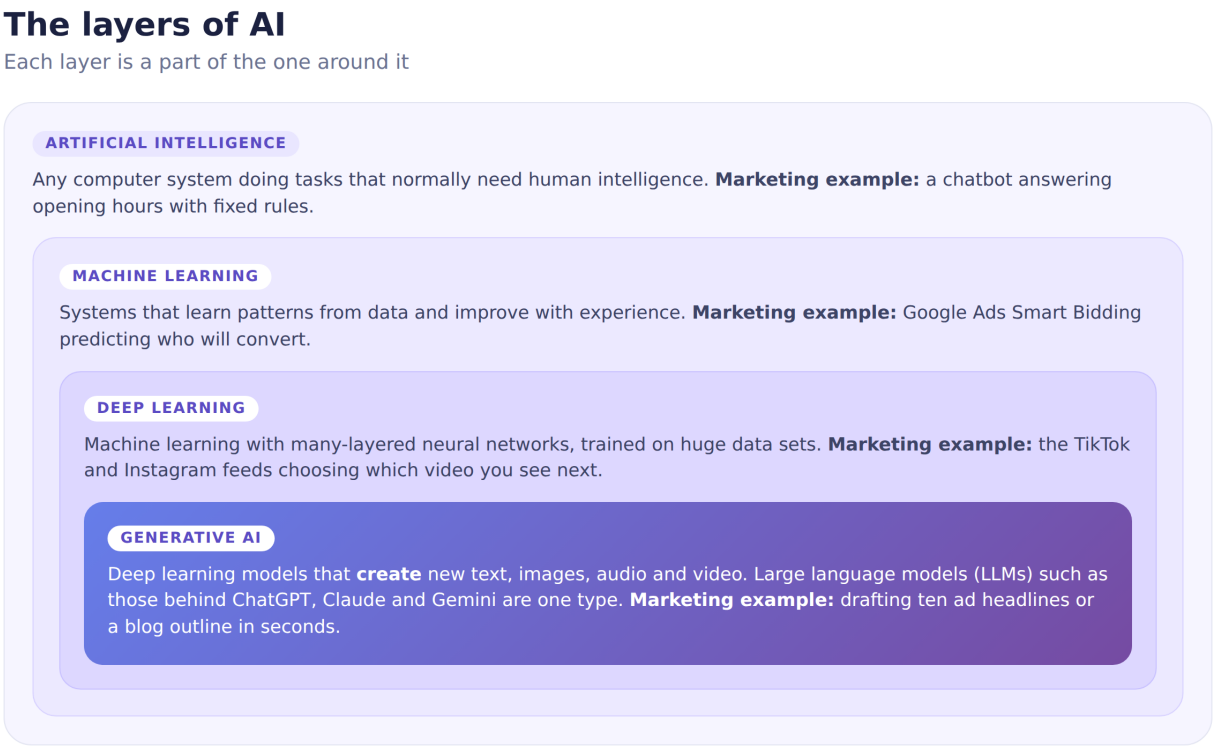

- **Volume and variation:** you can test more ideas, more hooks and more versions in more languages.
- **Access:** a small Mauritian business can get help that used to need an agency: research, copywriting, design ideas, data analysis.
- **What does not change:** strategy, knowledge of your customers, taste, local truth, relationships and responsibility. These stay human.

> **The mindset:** treat AI like a very fast, very well-read junior assistant who has never visited Mauritius, has never met your customers and sometimes invents things with confidence. Brief it well, check its work, and you will save hours every week.

SECTION 2

The layers of AI

People use "AI" for many different things. The trainer’s deck shows AI as layers, like Russian dolls: each smaller layer is a special part of the bigger one. Knowing the layers helps you understand what a tool can and cannot do.

The layers in plain English

Layer	How it works	Where marketers meet it
Artificial intelligence	The whole field: any system that imitates human thinking, including fixed rules	Simple chatbots, rule-based email triggers
Machine learning (ML)	Learns patterns from past data to make predictions or decisions	Smart Bidding, lookalike audiences, churn prediction, spam filters
Deep learning (DL)	ML with neural networks of many layers; very good with images, sound and language	Social feeds, image recognition, voice search, automatic captions
Generative AI (GenAI)	Deep learning models that produce new content from a request (a prompt)	ChatGPT, Claude, Gemini, Canva AI, image and video generators

Predictive AI vs generative AI

Most AI in advertising platforms is **predictive**: it predicts who will click, buy or leave, and adjusts bids or audiences. **Generative** AI creates new content. Many tools now combine both. For example, Performance Max (Section 21) predicts where to show ads **and** can generate new images and text from your assets.

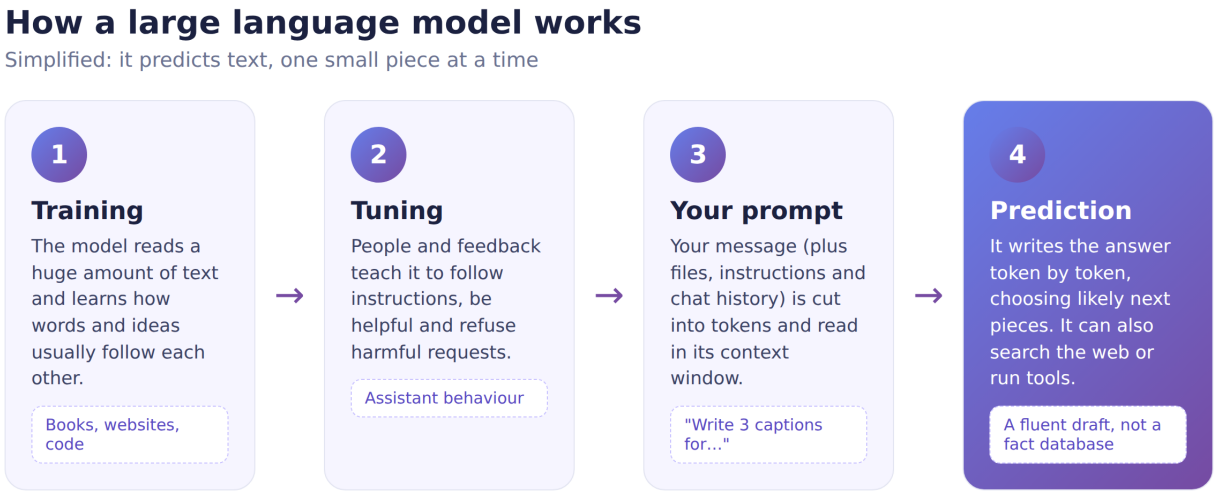

Types of generative AI

Type	Creates	Examples (October 2026)
Large language models (LLMs)	Text, code, tables, summaries	ChatGPT, Claude, Gemini, Copilot, Meta AI
Image models	Pictures and graphics from text	Image tools inside ChatGPT and Gemini, Canva AI, Midjourney, Adobe Firefly
Video models	Short video clips from text or images	Google Veo (in Gemini and Flow), video tools in CapCut and Canva
Audio and voice	Voice-overs, music, transcripts	Voice modes in assistants, CapCut text-to-speech, transcription tools
Multimodal assistants	Read and produce several types at once	Upload a photo of a menu and ask for a price table and captions

SECTION 3

How large language models work

A large language model (LLM) is the engine behind ChatGPT, Claude and Gemini. You don’t need to be technical to use one, but four ideas explain almost everything about how they behave: training, tokens, the context window and prediction.

1. Training: learning from huge amounts of text

An LLM is trained on a very large collection of text: public web pages, books, articles, code and other licensed or public data. From this, it learns which words, ideas and structures usually go together. It does **not** store a copy of the internet that it can look up. It learns patterns, a bit like someone who has read millions of pages and remembers the general ideas but not every exact sentence.

After this first training, the model is **tuned** with human feedback to follow instructions, answer helpfully, write in a conversation style and refuse harmful requests. Each model has a **knowledge cut-off**: it knows little about events after its training data ends unless it searches the web.

2. Tokens: how the model reads

The model does not read words like we do. It cuts text into **tokens**: small pieces of words. In English a token is on average about three-quarters of a word, so 100 words are roughly 130 tokens. French and Kreol often need more tokens per word, because the models saw less of these languages during training.

Why tokens matter	What it means for you
Usage limits are counted in tokens	Very long chats and big files use up your free allowance faster
Models handle common words best	Place names like "Trou aux Biches" or Kreol words may be split and misunderstood: check spelling in outputs
Counting is hard for the model	It may miss exact word or character counts: always check length limits for ads (Week 6)

3. The context window: the model’s working memory

The **context window** is everything the model can "see" at once: your instructions, the conversation so far, uploaded files and its own answers. Modern assistants have large context windows (enough for long reports), but they are not unlimited. In a very long chat, early details can be forgotten or given less attention.

- Start a **new chat** for each new task, and paste the key brief again.
- Put the most important instructions at the start **and** repeat them briefly at the end of long prompts.
- Use **Projects** or custom instructions (Section 11) so your brand brief is loaded every time.
- **Memory** features (in ChatGPT, Claude and Gemini) remember some facts about you between chats; you can view, edit or switch them off in settings.

4. Prediction: why the answers sound so fluent

When you send a prompt, the model writes the answer one token at a time, each time choosing a likely next piece based on everything before it. A setting called **temperature** controls how adventurous these choices are, which is why the same prompt gives a different answer each time. This is useful for brainstorming (ask for "20 different ideas") and a reason to save prompts that work well (Section 12).

> **Tip:** modern assistants are more than the language model. They can **search the web**, **read files** (PDF, Excel, images), **run code** to calculate and make charts, and **remember** your preferences. When you need current facts, ask the assistant to search and show its sources.

SECTION 4

Why AI makes mistakes: hallucinations, bias and limits

Because an LLM predicts likely text rather than looking up facts, it can produce answers that sound perfect and are completely wrong. These are called **hallucinations**. Google’s own guidance for website owners reminds them that generative models predict word sequences and can hallucinate, so every AI-generated text should be fact-checked before publishing.

What AI does well, and where it fails

Use it as a fast, tireless junior assistant, never as the final judge

STRONG

Good at

- First drafts and many variations
- Brainstorming angles and ideas
- Summarising long text, reviews, transcripts
- Restructuring: tables, outlines, checklists
- Changing tone, length and format
- Translating and simplifying
- Spotting patterns in a spreadsheet
- Explaining a concept step by step

WEAK

Bad at (without help)

- Exact facts, prices, dates and figures
- Recent news (unless it searches the web)
- Local Mauritian details it never saw
- Your business, customers and results
- Knowing when it is wrong: it sounds confident
- Original taste and lived experience
- Precise maths in long text answers
- Legal, medical or financial judgement

Common hallucinations in marketing work

What AI invents	Example	Protection
Statistics and studies	"72% of Mauritians shop online every week"	Ask for the source link, open it, or remove the number
Local facts	Wrong opening hours, a beach that does not exist, a wrong bus route	Use your own facts in the prompt; check on Google Maps
Quotes and reviews	A quote from a "happy customer" who never existed	Only use real, approved quotes
Laws and rules	An invented article of the Data Protection Act	Read the official text or ask a lawyer
Links and references	A URL that leads nowhere	Click every link before publishing
Product features	Features your competitor or your own product does not have	Check against the real product page

Why hallucinations happen

- The model fills gaps: when it does not know, it produces the most plausible-sounding answer instead of saying "I don’t know".
- Small markets are under-represented: there is far less text online about Rose Hill bakeries than about London bakeries.
- Long or confusing prompts: mixed instructions make the model guess.
- Old training data: prices, names and rules change after the knowledge cut-off.

Bias

AI learns from human writing, including its stereotypes. Image tools may show "a Mauritian family" or "a business owner" in a narrow, unrealistic way; text tools may assume a reader is male, Western or wealthy. Mauritius is a multicultural society: check that AI content represents its people fairly and respectfully, in every community, age and region.

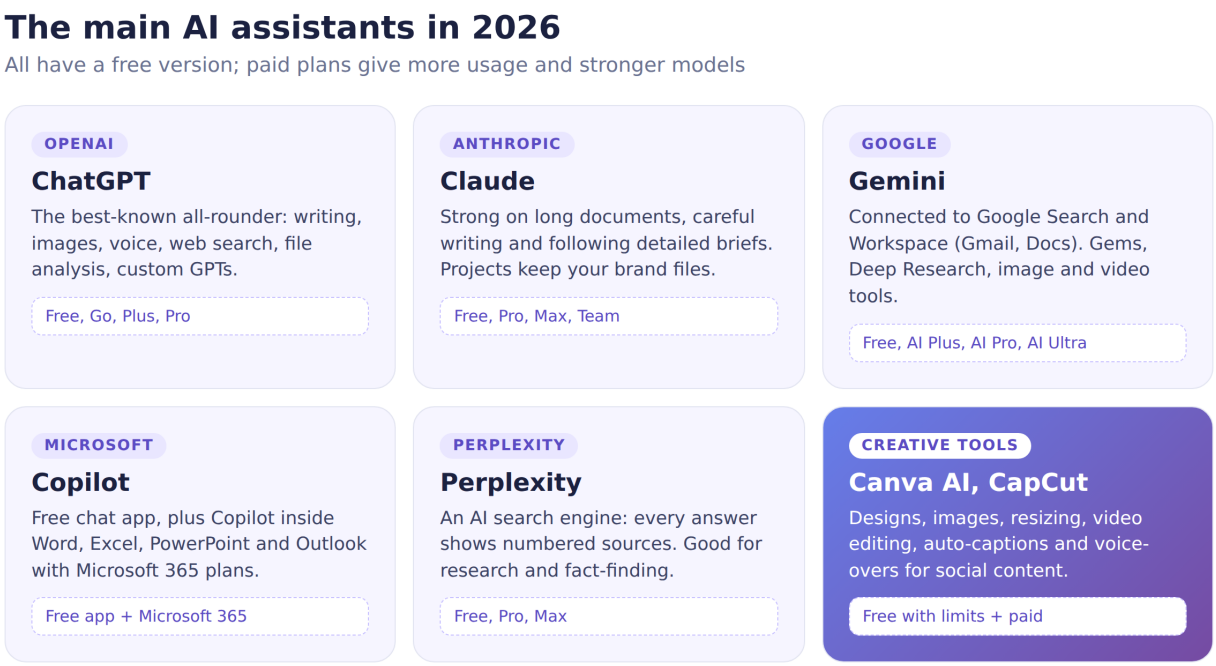

How to reduce mistakes

1. Give the AI your facts (prices, hours, offers) in the prompt instead of asking it to know them.
2. Tell it: "If you are not sure, say so. Do not invent figures, quotes or sources."
3. For research, use tools that show sources (Perplexity, or web search in ChatGPT, Claude or Gemini) and open the sources.
4. Ask a second model to check the first one’s answer for errors.
5. Always finish with a human fact-check (Section 25).

SECTION 5

The main AI assistants in 2026

There are many AI tools, but five general assistants cover almost every marketing need, plus a few creative tools for visuals and video. Products and model names change every few months, so focus on what each tool is good at rather than version numbers.

Assistant	Strengths for marketers	Watch out for
ChatGPT (OpenAI)	All-rounder; strong image generation; voice; custom GPTs; Deep Research; file and data analysis; large community of shared prompts	Free plan has limited use of the best models; some plans may show ads
Claude (Anthropic)	Natural, careful writing; follows long, detailed briefs; reads long PDFs; Projects with your brand files; creates documents and spreadsheets	Does not generate images; free usage limits can be reached quickly with long files
Gemini (Google)	Live Google Search knowledge; works inside Gmail, Docs and Sheets on paid plans; Gems; Deep Research; image and video generation	Workspace features depend on your plan and country
Microsoft Copilot	Free chat with web answers; with Microsoft 365 plans, Copilot inside Word, Excel, PowerPoint and Outlook	In-app features are only for the plan owner on family plans
Perplexity	AI search with numbered sources on every answer; good for fact-finding and competitor research	Less suited to long creative writing
Meta AI	Built into WhatsApp, Instagram and Facebook; quick ideas and images on mobile	Do not share customer data in it

Creative AI tools for content

Tool	What it does
Canva AI	Generates designs from a prompt or brief, applies your brand kit (fonts, colours), edits images, resizes designs and writes text. In 2026 Canva launched "Canva AI 2.0", a conversational assistant that builds multi-format campaigns, connects to tools like Google Drive and HubSpot, and schedules recurring tasks.
CapCut	Video editing with AI auto-captions, text-to-speech voice-overs, background removal, auto-cut and templates for Reels and TikTok.
Image generators	ChatGPT and Gemini image tools, Midjourney, Adobe Firefly: concept visuals, backgrounds, mood boards. Use real photos for real products and places.
Notebook tools	Google's notebook tool (NotebookLM) answers questions only from the sources you upload and can create audio summaries.

In Mauritius: all five assistants work in English and French, and they understand some Kreol Morisien. Their knowledge of local businesses, places and prices is limited and often out of date. Give them local facts yourself, and check anything they say about Mauritius.

SECTION 6

Free vs paid plans, privacy settings and your toolkit

You can do everything in this week's exercises with free plans. Paid plans mainly give more usage, stronger models and extra features. Prices below are from the official pricing pages in October 2026, in US dollars (USD) as charged; at about Rs 47 to the dollar, USD 20 is roughly Rs 950 a month before bank card fees.

Assistant	Free plan	Main paid plans (per month)
ChatGPT	Everyday models, limited image creation, limited Deep Research, Projects	Go (low-cost; USD 8 in the US, may include ads), Plus (USD 20), Pro (USD 100; the USD 200 tier is closed to new sign-ups since September 2026)
Claude	Sonnet and Haiku models, up to 5 Projects, web search, memory, file creation	Pro (USD 20, or USD 17 billed yearly), Max (from USD 100), Team (from USD 20 per seat yearly)
Gemini	Fast model, Gems, Deep Research, image tools, 15 GB storage	Google AI Plus (USD 4.99), AI Pro (USD 19.99, Gemini in Gmail and Docs, 5 TB), AI Ultra (from USD 99.99)
Copilot	Free app and web chat	Microsoft 365 Personal, Family or Premium plans add Copilot in Office apps
Perplexity	Unlimited basic searches, a few Pro searches	Pro and Max plans; Enterprise Pro from USD 40 per seat
Canva	About 20 AI uses a month	Canva Pro: standard AI tools unlimited, up to about 200 premium AI uses a month

Prices, plan names and limits change often and some are adjusted by country. Check the official pricing page before you buy.

Do you need a paid plan?

- **Start free** with two or three assistants and compare them on your own tasks this week.

- **Pay for one** when you hit limits every day or need a feature (custom GPTs, Projects with many files, Gemini in Gmail). For most marketers, one paid assistant at about USD 20 a month is enough.
- **For a team**, choose a business plan (ChatGPT Business, Claude Team, Google Workspace with Gemini, Microsoft 365 Copilot). These give admin control and, by default, your business data is not used to train the models.

Privacy settings to check today

On free and personal plans, your conversations may be used to improve the models unless you switch this off. Each assistant has a setting for this:

Assistant	Where to look (names may change)
ChatGPT	Settings → Data controls → "Improve the model for everyone"; Temporary chat for sensitive tasks
Claude	Settings → Privacy → model improvement setting; incognito chat
Gemini	Gemini Apps Activity (Keep Activity) settings in your Google account
Copilot	Settings → Privacy → model training settings

> **Golden rule:** never paste confidential data into a personal AI account: customer names, phone numbers, emails, ID numbers, health data, staff salaries, passwords, unpublished financial results or client documents under NDA. Remove or replace personal details first ("Customer A", "Rs X"). Section 26 explains why under the Data Protection Act 2017.

Your starter toolkit for this week

Need	Suggested tool
Writing, strategy, long documents	Claude or ChatGPT
Research with sources	Perplexity, or web search in Gemini, ChatGPT or Claude
Working in Gmail, Docs, Sheets	Gemini (or Copilot for Microsoft 365 users)
Visuals and social designs	Canva AI, ChatGPT or Gemini image tools
Short videos and captions	CapCut
Your prompt library	Google Sheets, Notion or Google Docs (Section 12)

PART B

Prompting

The C.A.R.E. framework, prompting techniques, brand voice and your own prompt library

SECTION 7

The C.A.R.E. prompting framework

A prompt is the instruction you give an AI. The quality of the answer depends mostly on the quality of the prompt. The trainer's framework, **C.A.R.E.**, is an easy way to remember the four ingredients of a good prompt: Context, Action, Result and Example.

A weak prompt and a C.A.R.E. prompt

> **Weak prompt:** "Write a post about our Divali cakes."

The answer will be generic: "Celebrate the festival of lights with our delicious cakes!" with invented prices and hashtags. Now compare:

```
CONTEXT: You are the social media copywriter for Lakaz Gato, a family cake shop in
Rose Hill, Mauritius. Our customers are families aged 25-45 in Plaines Wilhems.
Our voice is warm, simple and a little playful. For Divali we sell a "Lumière box":
12 assorted sweets and mini cakes, Rs 650, order by WhatsApp 5XXX XXXX,
collection in Rose Hill or delivery in Plaines Wilhems (Rs 100).

ACTION: Write 3 different Instagram captions to promote the Lumière box.

RESULT: Each caption max 60 words, in English, with one short French phrase allowed.
Start with a hook in the first line. End with "Order on WhatsApp". No hashtags
except #LakazGato. Do not invent any facts, prices or offers.

EXAMPLE: Here is a caption that worked well for us last year:
"Gato pou tou lafami! Our Christmas box is back: 10 treats, 1 happy table.
Order on WhatsApp before 20 December."
```

Each C.A.R.E. ingredient in detail

Ingredient	Include	Questions to ask yourself
Context	Business, product, audience, situation, voice, facts, what has been tried	What would a new freelancer need to know before starting?
Action	One main task with a precise verb	Am I asking for one thing, clearly?
Result	Format, length, tone, language, number of options, must-include, must-avoid	How will I use the output? Where will I paste it?
Example	One or two samples of the style you want, or a template to fill	Do I have a past post, email or ad I like?

> **Tip:** if you have no example yet, skip the E the first time. When you get an answer you love, save it: it becomes the example for your next prompt.

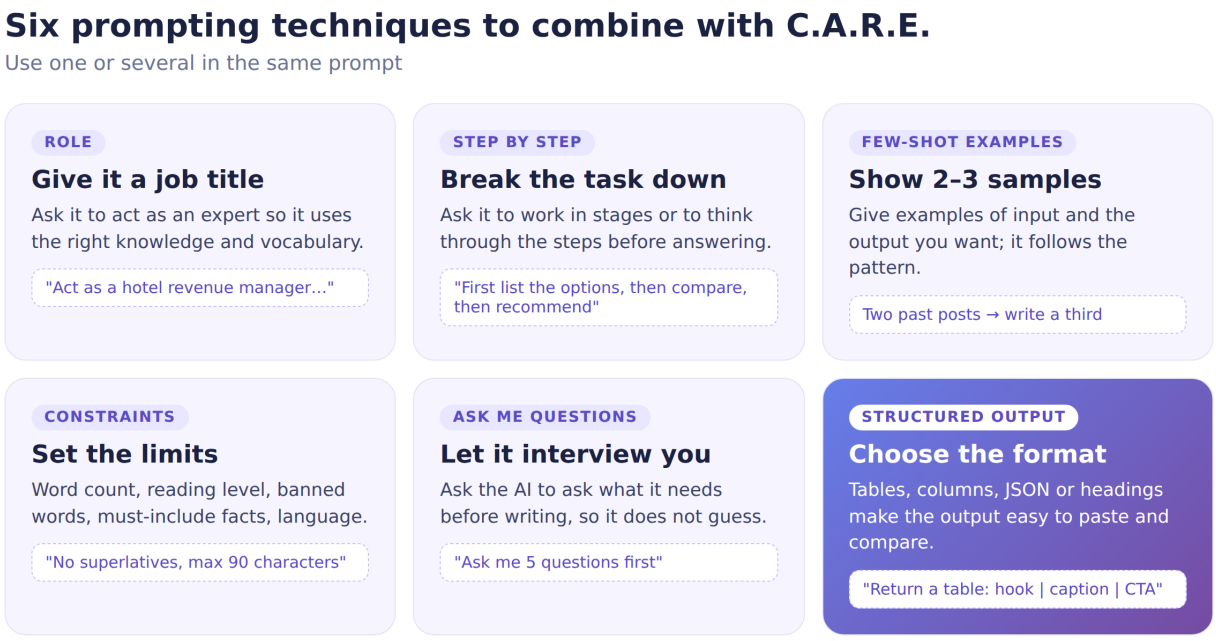

Other frameworks you may meet

You will see other acronyms online, such as RTF (Role, Task, Format) or CO-STAR (Context, Objective, Style, Tone, Audience, Response). They all describe the same ideas. Use C.A.R.E. as your default and add the techniques in Section 8.

SECTION 8

Core prompting techniques

C.A.R.E. gives the structure. These six techniques make prompts stronger. Most good prompts combine two or three of them.

1. Role prompting

Giving the AI a role sets the expertise, vocabulary and point of view. Be specific: "Act as an experienced hotel marketing manager in Mauritius who knows the French and South African markets" works better than "Act as a marketer".

2. Step-by-step instructions

For complex tasks, break the work into steps or ask the AI to reason through them first. Many assistants also have a "thinking" or "reasoning" mode for harder problems such as strategy, maths or data analysis.

```
Analyse the attached reviews of Lagon Bleu Guesthouse in 3 steps:
1. List the 5 most frequent positive themes, with the number of reviews for each.
2. List the 5 most frequent complaints, with the number of reviews for each.
3. Suggest 3 actions for management and 3 marketing messages based on the positives.
```

3. Few-shot examples

"Few-shot" means giving a few examples of what you want. Two or three examples teach the AI a pattern better than a long description. For instance, paste three of your best Facebook posts and ask for five more in the same style on new topics.

4. Constraints

Type of constraint	Example
Length	"Headlines of max 30 characters" (Google Ads, Week 6), "under 150 words"
Reading level	"Simple English for readers who speak English as a second language"
Must include	"Mention free parking and the Rs 1,500 monthly price"
Must avoid	"No superlatives like best or number one, no medical claims, no hashtags"
Language and spelling	"British English", "French as used in Mauritius"
Channel rules	"Suitable for a Meta ad: no personal attributes like ‘Are you overweight?’"

5. Ask the AI to ask questions

When you are not sure what to include, end your prompt with: **"Before you start, ask me up to 5 questions about anything you need to know."** The AI interviews you, and the answer is based on your real situation, not guesses.

6. Structured outputs

Ask for the output in the shape you will use: a table to paste in Google Sheets, headings for a blog, a numbered list, or columns for a content calendar. Tables also make it easy to compare options.

```
Return a table with these columns:
Day | Platform | Pillar | Format | Hook (max 10 words) | Caption (max 50 words) | CTA
```

> **More useful phrases:** "Give me 10 options, all very different." · "Explain your choice in one line." · "What is missing from this brief?" · "Rate each option from 1 to 10 for clarity and explain." · "Rewrite for someone who has never heard of us." · "Write the opposite point of view."

SECTION 9

Iterating: the conversation is the work

The first answer is rarely the best one. Good prompters treat AI like a conversation with a colleague: they react, correct and push for better. Most of the value comes from the second, third and fourth messages.

The iteration loop

1. **Ask** with a C.A.R.E. prompt.
2. **Review** the answer: what is good, what is wrong, what is missing?
3. **Give specific feedback:** "Option 2 is the best. Make it shorter, remove the second sentence, and add the delivery price."
4. **Ask for alternatives** when stuck: "Give me 5 completely different angles."
5. **Finish yourself:** edit the final version by hand so it sounds like you.

Feedback that works

Vague feedback	Specific feedback
"Make it better."	"Make the first line a question a busy mum would ask herself."
"Too long."	"Cut to 40 words. Keep the price and the WhatsApp CTA."
"More creative."	"Use a local image: something every Mauritian recognises, like the Sunday market."
"Not our tone."	"Less formal. Use ‘you’, short sentences, one light joke maximum."
"Wrong."	"The price is Rs 650, not Rs 600, and we don’t deliver to the North."

When to start a new chat

- The AI keeps repeating an error you corrected.
- You switch to a different task, client or business.
- The conversation is very long and answers get worse.
- Tip: before starting a new chat, ask: "Summarise everything we agreed in this chat as a brief I can paste into a new conversation."

Compare assistants

For important work, paste the same prompt into two assistants (for example Claude and ChatGPT, or Gemini and Copilot). Keep the best parts of each. Over time you will learn which tool works best for which task, and you will note this in your prompt library.

> **Tip:** ask the AI to critique its own work: "Review your answer as a strict marketing manager. List 5 weaknesses, then rewrite it to fix them." This simple step often improves quality a lot.

SECTION 10

A brand voice brief for AI

Without guidance, AI writes in the same polished, generic style for everyone. A **brand voice brief** is a one-page document that tells the AI (and any new team member) who you are and how you speak. In Week 4 you created a voice chart; now turn it into a brief you paste into every chat or save in a Project.

What to include

Part	Content	Lakaz Gato example
1. Who we are	Business, location, story, what makes us different	Family cake shop in Rose Hill since 2015, recipes from Grandma Marie, custom cakes
2. Audience	Main personas and what they care about	Parents 25–45 in Plaines Wilhems who want a beautiful cake without stress
3. Voice in 3 words	Personality, with "is / is not"	Warm (not childish), simple (not basic), playful (not silly)
4. Language	Languages, spelling, use of Kreol and French	English first; short Kreol or French expressions welcome; British spelling
5. Words we use / avoid	Vocabulary lists	Use: homemade, fresh, family, order. Avoid: cheap, luxury, indulge, elevate
6. Facts	Products, prices, hours, contact, delivery	Price list, WhatsApp number, delivery zones and fees
7. Rules	What never to say or do	No health claims, no comparisons with named competitors, no fake urgency
8. Examples	3–5 posts, emails or ads that represent the voice	Best Instagram caption, best email, best Google Business post

Let AI help you write it

```
I want to create a brand voice brief for my business so that AI tools write like us.
Here are 5 of our best posts and our "About us" page: [paste].
1. Describe our voice in 3 adjectives, each with "we are / we are not".
2. List words and phrases we use often, and generic words we should avoid.
3. Write the brief in the 8-part structure below, max one page: [paste structure].
Ask me questions about anything you cannot tell from the examples.
```

Remove the "AI voice"

AI text often has tell-tale signs: words like "delve", "unlock", "elevate", "seamless", "vibrant tapestry", "in today’s fast-paced world", too many dashes and lists of three, and an enthusiastic tone everywhere. Add a "words to avoid" list to your brief and always do a final human edit.

> **In Mauritius:** a voice that sounds like Mauritius is a strong advantage, because AI-generated content from big brands sounds the same everywhere. Local expressions, real places (the bazaar in Port Louis, the beach at Trou aux Biches, a Sunday family lunch) and real people make your content stand out. Give the AI these details; it will not invent them correctly on its own.

SECTION 11

Custom instructions, Projects, custom GPTs and Gems

Pasting the same brief every time is slow. All major assistants let you save instructions and files so the AI starts each conversation already knowing your business.

Feature	Where	What it does	Best for
Custom instructions / personalisation	ChatGPT, Claude, Gemini settings	Instructions applied to all your chats (who you are, how you want answers)	Your personal preferences: language, length, style
Projects	ChatGPT, Claude (and similar in Gemini and Perplexity)	A workspace with its own instructions, files and chat history	One project per business or client
Custom GPTs	ChatGPT (creating needs a paid plan)	A reusable assistant with instructions, files and optional tools; can be shared	A repeated task: "Lakaz Gato caption writer"
Gems	Gemini (free and paid)	A custom version of Gemini with saved instructions and files	Same as custom GPTs, inside Google's ecosystem
Skills and styles	Claude and others	Saved writing styles or task instructions the assistant can apply	Consistent formats and tones

Set up a Project for a business, step by step

1. Create a new Project (for example "Lagon Bleu – Marketing") in ChatGPT or Claude.
2. In the project instructions, paste a short version of the brand voice brief and the rules: "Always use British English. Never invent prices or facts. Ask if information is missing."
3. Upload reference files: brand voice brief, price list, FAQ, best past posts, persona sheet. Remove any personal customer data first.
4. Start every task for this business inside the project.
5. Update the files when prices, offers or seasons change.

Build a simple custom GPT or Gem

```
Name: Lagon Bleu – Review Reply Assistant
Instructions:
You help the manager of Lagon Bleu, a 12-room guesthouse in Trou aux Biches,
reply to guest reviews on Google and Tripadvisor.
- Reply in the language of the review (English or French).
- Thank the guest by first name, mention one specific detail from their review.
- For complaints: apologise once, explain what we changed (only if the manager
  tells you), invite them to contact us at the email in the knowledge file.
- Max 80 words. Warm, professional, never defensive. Sign "Priya, Lagon Bleu".
- Never offer refunds or discounts. Never invent facts.
Knowledge: house rules, room descriptions, contact details (PDF).
```

> **Tip:** test a custom assistant with 5–10 real examples before sharing it with the team, including difficult cases (an angry review, a review in French, a review that mentions a staff member by name).

SECTION 12

Your prompt library

A prompt library is a shared document or sheet where you save prompts that work, with notes on how to use them. It turns individual tricks into a team asset and is a key part of this week’s deliverable.

How to build it

1. Create a Google Sheet or Notion database with the columns below.
2. Each time a prompt gives a great result, save it with placeholders in [brackets] for the parts that change.
3. **Test** each prompt at least twice, ideally in two assistants, and note which worked best.
4. Add an example of a good output, and rate the prompt from 1 to 5.
5. Review the library monthly: improve weak prompts, delete unused ones, add new versions.

Column	Example
ID and name	SOC-03 · Three Instagram captions for a product
Category	Social media
Goal	Promote one product with 3 caption options
Prompt (with [placeholders])	C.A.R.E. prompt with [product], [price], [audience], [example caption]
Best tool	Claude (natural tone); ChatGPT also good
Inputs needed	Product facts, price, photo description, best past caption
Example output	Link to a doc with the best result
Quality rating and notes	4/5 · add "no hashtags" or it adds 15
Time saved	About 20 minutes per post (estimate)
Owner and last tested	Anisha · 03/10/2026

Categories to start with

Research · Personas · Strategy · SEO and blog · Social media · Video scripts · Email · Ads · Translation · Reviews and customer service · Data analysis · Reporting. Aim for at least 15 tested prompts across 5 categories for your deliverable (Section 29).

> a prompt library is not a set of magic spells. The same prompt can give different answers on different days and in different tools, and tools change often. Keep the human review step for every output.

PART C

Marketing applications

Research, strategy, SEO, social, email, ads, translation and data analysis with AI, step by step

SECTION 13

Research and personas with AI

Good marketing starts with understanding the audience. AI can speed up research and help you build personas, but only if you feed it real information. AI-only personas are guesses dressed up as facts.

Step by step: build a persona from real data

1. **Collect real inputs**: customer reviews, frequent WhatsApp questions, comments, survey answers, sales notes, GA4 demographics (Week 2), search terms (Week 3). Remove names and phone numbers.
2. **Ask AI to find patterns**: "From these 60 customer messages, group the main needs, worries and words customers use."
3. **Draft 2–3 personas** using the patterns, with the C.A.R.E. structure.
4. **Check with reality**: show the personas to staff who talk to customers. What is wrong? What is missing?
5. **Keep them in your Project** so every future prompt uses them.

```
CONTEXT: FitZone is a gym in Quatre Bornes (600 members, from Rs 1,500/month).
Below are 45 anonymised messages from people who asked about membership,
and 30 reviews. [paste]
ACTION: Create 3 customer personas based ONLY on this data.
RESULT: For each persona: name and short description, age range, goals,
fears and objections (with quotes from the data), questions they ask,
best channels and times, the message that would convince them.
Format as a table. Mark clearly anything you are guessing.
```

Other research tasks AI does well

Task	Example prompt idea	Best tool
Audience questions	"What questions do tourists ask before booking a guesthouse in the north of Mauritius? Search forums and reviews and cite sources."	Perplexity, Gemini, ChatGPT with search
Market overview	"Summarise trends in the Mauritius fitness market with sources from the last 2 years."	Deep Research modes
Jobs to be done	"What is the customer really trying to achieve when ordering a birthday cake?"	Any assistant
Objection list	"List 15 reasons someone might not join a gym, and an answer for each."	Any assistant
Survey design	"Write a 6-question survey for our customers in English and French."	Any assistant, then Google Forms

Tip: Deep Research modes (in ChatGPT, Gemini, Claude and Perplexity) search many websites for several minutes and write a report with sources. They are excellent for a first market overview. Open the key sources and check the numbers before using them.

SECTION 14

Competitor analysis and review summaries

AI is very good at reading a lot of text quickly. Use it to analyse competitors' public content and to turn hundreds of reviews into clear insights.

Competitor analysis, step by step

1. List 3–5 competitors (Week 1 audit, Week 5 benchmark).
2. Collect public information: website pages, Google Business Profile, social posts, ads from the Meta Ad Library and Google Ads Transparency Center (Weeks 8 and 6), reviews.
3. Paste or upload the content, or ask an assistant with web search to visit the public pages.
4. Ask for a structured comparison (prompt below).
5. Add your own judgement: what do customers actually say? What can you do better?

```
Compare these 4 guesthouses in Trou aux Biches and Mont Choisy using the
information below [paste website text, review summaries, recent posts].
Return a table with: positioning in one line, target guests, price signals,
main promises, proof used (reviews, awards, photos), tone of voice, channels,
offers, and gaps. Then list 5 opportunities for Lagon Bleu that no competitor
covers well. Do not invent information that is not in the text.
```

Summarising reviews

Copy reviews from Google, Tripadvisor or Facebook into a spreadsheet (date, rating, text), remove reviewer names, and upload the file. Then ask:

```
Analyse the attached 180 reviews of Lagon Bleu (2024-2026).
1. Top 5 positive themes and top 5 negative themes, with counts and 2 short quotes each.
2. How themes changed between 2024 and 2026.
3. Words guests use to describe us (for our SEO and ads).
4. 3 operational fixes and 5 marketing messages backed by the reviews.
```

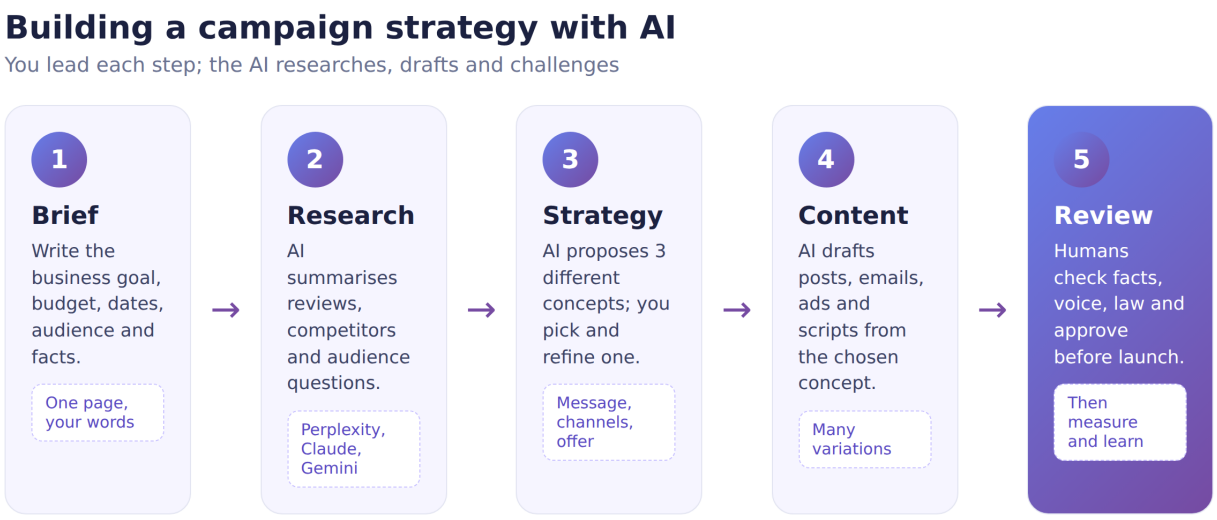

Review insight (illustrative)	Marketing action
"Breakfast on the terrace" mentioned in 40% of 5-star reviews	Make breakfast the hero of Instagram Reels and Google Business photos
"Close to the beach, 2 minutes walk"	Use the phrase in ads and on the website (real words customers use)
"Wi-Fi weak in rooms" in 12 complaints	Fix first; then reply to reviews explaining the upgrade

never ask AI to write fake reviews, fake customer quotes or fake competitor reviews. It is dishonest, breaks platform rules (Google, Tripadvisor and Meta remove fake reviews and can penalise the business), and can break consumer protection laws. See Section 27.

SECTION 15

Campaign strategy with AI

The core of this week's deliverable is an **AI-generated campaign strategy document**. "AI-generated" does not mean "AI-decided": you give the brief, the AI drafts and challenges, and you make the decisions.

Step 1: write the brief yourself

Business, objective (SMART, Week 1), budget, dates, audience, offer, channels available, constraints, past results. AI cannot know these: they are your input.

Step 2: ask for three different concepts

```
CONTEXT: [paste brief]. Brand voice: [paste or use project files].
ACTION: Propose 3 very different campaign concepts for the winter season
(June-August) to fill weekday rooms with Mauritian residents.
RESULT: For each concept: name, big idea in one sentence, key message,
offer, target segment, channels and role of each channel, 3 example
headlines, risks. Then recommend one and explain why in 5 lines.
```

Step 3: develop the chosen concept into a strategy document

Section of the document	What to ask the AI
1. Situation and objective	Summarise the brief; check the objective is SMART
2. Audience and insight	Personas (Section 13) and one key insight
3. Big idea and messages	Main message, 3 supporting messages, proof points
4. Channel plan	Role, format and budget split per channel (organic social, Meta Ads, Google Ads, email, WhatsApp)
5. Content plan	Calendar of posts, emails and ads with dates
6. Budget and KPIs	Targets per channel; how to measure in GA4 (key events) and ad platforms
7. Risks and tests	What could go wrong; A/B tests to run
8. Timeline and owners	Who does what, when

Step 4: challenge the strategy

- "Act as a sceptical finance director. What are the 5 weakest points of this plan?"
- "Which assumptions are not supported by the brief?"
- "What would a competitor do in response?"
- "Simplify this plan for a business with one person doing marketing 5 hours a week."

> **In Mauritius:** budgets and audiences in Mauritius are small. AI tends to propose big, international-style plans with many channels and influencers. Ask it to adapt: "Our total budget is Rs 40,000 for 2 months and one person runs marketing part-time. Keep only what is realistic."

SECTION 16

SEO and AEO content with AI

In Week 3 you learned SEO (Search Engine Optimisation), AEO (Answer Engine Optimisation) and GEO (Generative Engine Optimisation). AI can speed up every step of SEO content, but Google is clear: content made mainly to rank, mass-produced without adding value, can be treated as spam ("scaled content abuse").

What Google says about AI content

- Using AI is allowed. What matters is whether the content is helpful, reliable and made for people.
- Mass-producing many pages without adding value for users may violate the scaled content abuse spam policy.
- Fact-check everything, including titles, meta descriptions, structured data and image alt text.
- Consider explaining to readers how content was created when automation was used substantially.
- For Google Merchant Center, AI-generated product images need special metadata, and AI-generated product titles and descriptions must be labelled as such.

A blog article with AI, step by step

1. **Keyword and question research** (Week 3): choose one main keyword and 5–10 questions. AI can cluster your keyword list by intent: "Group these 80 keywords into topics and say which page should target each."
2. **Outline**: ask for H2/H3 headings that answer each question, with an answer-first summary at the top (AEO).
3. **Add your experience**: write notes on what only you know: real prices, photos, examples, opinions, mistakes customers make.
4. **Draft** section by section with your notes, in your brand voice.
5. **Edit and fact-check**: cut generic sentences, check every fact, add internal links.
6. **SEO details**: ask for 5 title tag options (max 60 characters) and meta descriptions (max 155 characters); ask for FAQ schema JSON-LD and validate it in the Rich Results Test (Week 3).

```
Write an outline for a blog article: "How to choose a birthday cake in Mauritius:
sizes, prices and timing". Audience: parents ordering for the first time.
Start with a 50-word direct answer. Use H2s that match these questions: [paste].
For each H2, list what my experience notes should cover (I will add them).
Then suggest 3 internal links to these pages on lakazgato.mu: [paste list].
```

AI search and GEO: the link with Week 3

People increasingly ask ChatGPT, Gemini, Perplexity, Copilot and Google AI Mode for recommendations. Week 3 gave you the GEO playbook: SEO basics, a complete Google Business Profile, a consistent identity everywhere, mentions on trusted sites, quotable answer-first content and allowing AI search crawlers. This week, add two habits:

- **Monthly prompt test:** ask 10 customer questions in 4 assistants and note whether your business is mentioned (Week 3 template).
- **Use AI to improve "quotability":** "Rewrite this section so each paragraph answers one question clearly and could be quoted alone, without losing our facts."

SECTION 17

Social media captions, scripts and visuals

Social media (Week 5) needs a lot of content. AI helps with ideas, hooks, captions, video scripts, visuals and replies, while your real photos, faces and stories keep it authentic.

Content ideas and hooks

```
Give me 20 content ideas for FitZone (gym in Quatre Bornes) for the pillar
"Beginner tips" for women aged 25-45 who feel intimidated by gyms.
Mix formats: Reels, carousels, stories. For each: format, hook (max 10 words),
one-line description. Avoid body-shaming and before/after weight promises.
```

A short video script

```
Write a 30-second Reel script for FitZone: "3 exercises if you're scared of the gym".
Format as a table: time | what we see | what the coach says | on-screen text.
Hook in the first 2 seconds. Coach Kevin speaks English with a few Kreol words.
End with: "Your first class is free. Send us a WhatsApp."
```

Visuals with Canva AI and image generators

- **Use AI for:** backgrounds, illustrations, mood boards, layout ideas, resizing one design for every platform, removing backgrounds from product photos.
- **Use real photos for:** your products, your premises, your team and your customers. An AI-generated "cake" or "room" that does not exist misleads customers.
- Set up your **brand kit** in Canva (logo, colours, fonts) so AI designs stay on brand.
- Describe images precisely: subject, setting, light, style, format ("square, bright natural light, top view of a wooden table with Mauritian sweets, no text").

Video with CapCut

1. Film short clips on your phone (real people, real place).
2. Import into CapCut and use auto-cut or a template to assemble.
3. Add auto-captions; always correct names, prices and Kreol words.
4. Add a text-to-speech voice-over only if no one can record their own voice; a real voice builds more trust.
5. Export in 9:16 and post natively on each platform (Week 5).

Platform AI labels

Platforms ask you to label realistic AI-generated content. TikTok requires a clear label for realistic AI-generated content; YouTube asks creators to disclose realistic altered or synthetic content in YouTube Studio; Meta shows an "AI info" label and asks people to disclose photorealistic AI video and realistic audio. Section 27 explains the rules.

SECTION 18

Email sequences and ad copy variations

Email (Week 10) and ads (Weeks 6–9) need many short texts that follow strict rules. AI is excellent at producing structured variations for you to choose and test.

An email sequence

```
CONTEXT: Lagon Bleu guesthouse, Trou aux Biches. New subscribers come from a
"Winter weekend guide" lead magnet. Voice: warm, relaxed, helpful. [brand brief]
ACTION: Write a 4-email welcome sequence.
RESULT: Table first: email number, day sent, goal, subject (max 45 characters),
preheader (max 90 characters), CTA. Then the full text of each email
(max 150 words). Email 3 introduces the Rs 3,900 weekday offer for residents.
Write subjects in English and French versions.
```

Ad copy variations

Google Responsive Search Ads (Week 6) need up to 15 headlines of 30 characters and 4 descriptions of 90 characters. Meta ads (Week 8) need primary text, headlines and descriptions. AI can draft many angles quickly:

```
Write 15 Google Ads headlines (max 30 characters each, count carefully) and
4 descriptions (max 90 characters) for FitZone free trial class, Quatre Bornes.
Use 5 angles: price, beginners, location, coaches, results without pressure.
Include the keyword "gym Quatre Bornes" in at least 3 headlines.
Return a table with the character count of each line.
```

Rule	Why
Check character counts yourself	AI often miscounts; the ad platform will reject or cut long lines
Check ad policies	No exaggerated claims, no personal attributes in Meta ads, no sensational health promises
Test angles, not just words	Ask for different reasons to buy, then A/B test them (Weeks 7 and 8)
Keep the facts identical	Price and offer must match the landing page exactly

Tip: Google Ads and Meta can also generate text and images inside the platform (AI Max, Performance Max asset generation, Advantage+ creative). Use your own AI drafts to stay in control of the message, and review every automatically generated asset. Week 14 covers this in depth.

SECTION 19

Translation: English, French and Kreol

Most Mauritian businesses communicate in English and French, and many customers prefer Kreol Morisien in casual conversation. AI translation is fast and usually good for English and French, weaker for Kreol, and never a replacement for a fluent human reviewer.

Language	AI quality (general)	Advice
English ↔ French	Usually very good	Ask for "French as used in Mauritius" and the right level of formality (tu / vous)
Kreol Morisien	Variable: spelling and expressions can be wrong or mixed with Seychellois or Haitian Creole	Use AI for a first idea only; a native speaker must rewrite and check spelling
Other visitor languages (German, Italian, Mandarin, Hindi)	Good for main languages	For important pages, ask a native speaker or professional to review

A localisation prompt

```
Translate this Instagram caption into French as spoken in Mauritius.
Keep it friendly and short, use "vous". Keep "Lumière box" and the price as is.
Then give a casual version that mixes French and a few common Kreol words,
and list any words you are not sure about.
Caption: [paste]
```

Rules for translated content

- Translate **meaning**, not words: ask the AI to adapt jokes, idioms and cultural references.
- Never publish legal text, prices, allergy or safety information without a fluent human check.
- Keep a **glossary** of your brand terms in each language in your Project (product names, slogans, how you write place names).
- For Kreol, follow the standard spelling taught in Mauritian schools if your audience expects it; ask your reviewer.

SECTION 20

Data analysis with AI: CSV files and reports

Assistants such as ChatGPT, Claude, Gemini and Copilot in Excel can read spreadsheets and CSV files (comma-separated values: a simple table file that every analytics tool can export), run calculations and make charts. This makes basic analysis accessible to everyone, while Week 11 goes deeper into analytics.

Step by step

1. Export the data: GA4 report, Meta Ads Manager, Google Ads, Mailchimp or your sales sheet, as CSV or Excel.
2. **Clean and anonymise**: remove names, emails and phone numbers. Keep only the columns you need.
3. Upload the file and describe it: "Each row is one Meta ad campaign for October 2026; spend is in Rs."
4. Ask specific questions, one at a time.
5. Ask the AI to **show its working** (formulas or code) and check two or three results yourself in Google Sheets.

```
Attached: Meta Ads export for Lakaz Gato, September-October 2026 (CSV).
1. Calculate CTR, CPC and cost per WhatsApp conversation for each ad.
2. Rank ads by cost per conversation and show the top 3 and bottom 3.
3. Make a bar chart of cost per conversation by ad.
4. In 5 bullet points, what should we change next month? Mark which
   conclusions are certain and which are guesses with too little data.
```

Good analysis questions

Question type	Example
Describe	"Which landing pages had the most key events in GA4 last month?"
Compare	"Compare cost per lead in September and October by campaign."
Explain	"What could explain the drop in email clicks? List hypotheses to test."
Predict (carefully)	"If the trend continues, about how many bookings in December? Show the method."
Summarise for a manager	"Write a 5-line summary for the owner, with one chart."

AI can make calculation mistakes, misread columns or draw strong conclusions from small numbers (10 clicks is not a trend). Always check key figures, and remember that correlation is not causation. Never upload customer-level personal data to a personal AI account.

PART D

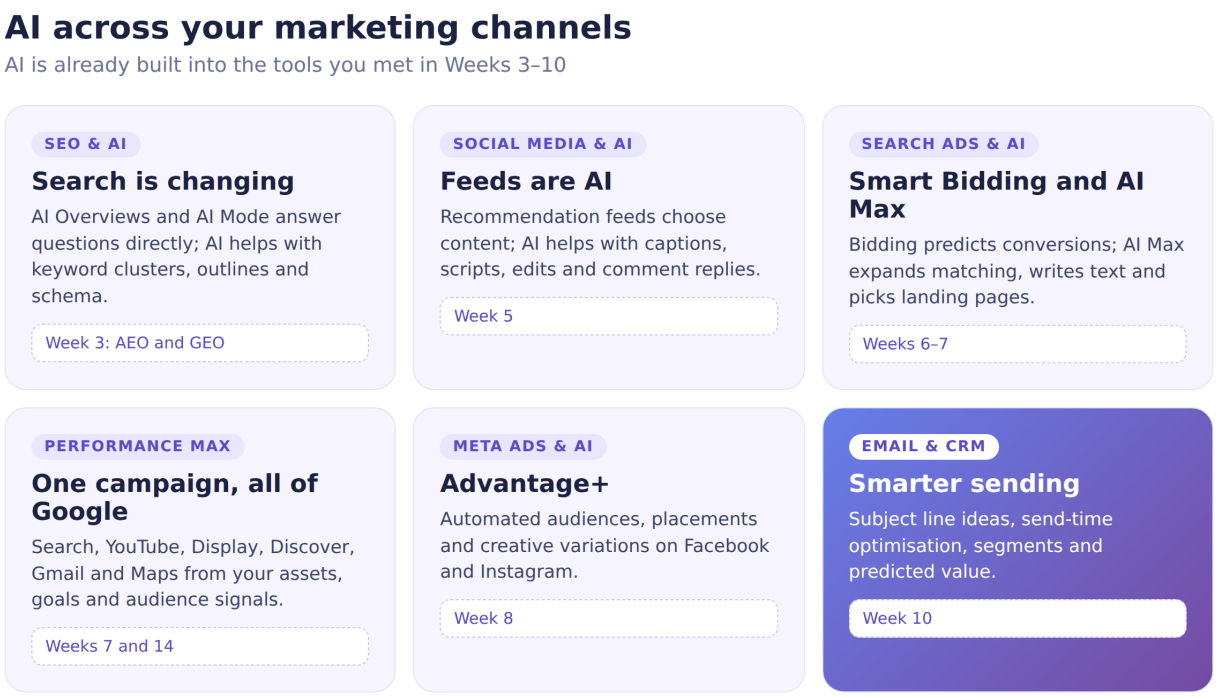

AI across channels and teams

SEO, social and search ads with AI, Performance Max, time-saving workflows and team routines

SECTION 21

AI inside your marketing channels

The trainer’s deck shows that AI is not only a chat window: it already runs inside search engines, social feeds and ad platforms. Knowing how it works there helps you give these systems the right inputs.

SEO and AI

Search engines use AI to understand queries and pages, and to write answers in AI Overviews and AI Mode. Your job (Week 3): be the clearest, most trusted source, so AI systems choose and cite you. Use AI assistants to help with keyword clustering, outlines, FAQ ideas, schema code and content audits ("Which questions does this page not answer?").

Social media and AI

Feeds on Facebook, Instagram, TikTok, YouTube and LinkedIn are chosen by AI recommendation systems (Week 5). They learn from watch time, shares and saves. AI helps you produce more tests (hooks, formats, captions), but the algorithm rewards what real people enjoy, so originality and real faces still win.

Search ads and AI

Google Ads has used machine learning for years: **Smart Bidding** predicts the chance of a conversion for each auction (Weeks 6–7). In 2026 Google is moving advertisers to **AI Max for Search campaigns**, an option that adds search term matching beyond your keywords, text customisation (AI-written headlines and descriptions based on your site and assets) and final URL expansion (choosing the best landing page). It replaces Dynamic Search Ads: Google started upgrading campaigns in 2026 and has announced that the full retirement of Dynamic Search Ads is planned for February 2027.

Performance Max

Performance Max (PMax) is a goal-based Google Ads campaign type that runs from one campaign across YouTube, Display, Search, Discover, Gmail and Maps. You provide:

- **Goals**: the conversion actions to optimise for (key events imported from GA4 or Google Ads conversions).
- **Assets**: headlines, descriptions, images, logos and videos. Google AI combines them and can generate new image and video variations.
- **Audience signals**: your customer lists, website visitors and interests, which help the AI learn faster (they are hints, not strict targeting).
- **Brand guidelines and exclusions**: to control how your brand appears.

Here generative AI (your prompts) and predictive AI (Google's bidding) meet: use the C.A.R.E. framework to write strong, varied assets, then let the campaign test them. Week 14 shows how to set up and steer PMax and AI Max in practice.

Meta Ads and AI

Meta's Advantage+ tools (Week 8) automate audiences, placements and budgets, and can create text and image variations of your ads. Review every automatic variation: AI may change the meaning, crop the product badly or add text you did not approve.

> **Tip:** ad platforms optimise for the goal you give them. If you tell the AI to find "clicks", it will find cheap clicks, not customers. Feed it real business goals (leads, bookings, sales) with good tracking (Weeks 2 and 11).

SECTION 22

Time-saving workflows

The biggest gain from AI comes not from one clever prompt but from building it into your weekly routines. A workflow is a repeatable sequence: inputs, prompts, human checks, output.

Typical time savings (illustrative estimates)

Task	Without AI	With AI + human review	How
Monthly content calendar (12 posts)	4 hours	1.5 hours	Ideas and drafts from a saved prompt; human edits and photos
Blog article (1,000 words)	5 hours	2.5 hours	Outline and draft from notes; human experience and fact-check
Replies to 20 reviews	1.5 hours	30 minutes	Custom GPT or Gem drafts; manager personalises
Monthly ad report summary	2 hours	45 minutes	CSV upload, analysis, summary; human checks numbers
Translating a newsletter EN to FR	1 hour	20 minutes	AI translation, fluent human review
Competitor overview	3 hours	1 hour	Research with sources, structured table

These are examples to show the order of magnitude, not measured averages. Measure your own times before and after for a month.

Five workflows to set up this week

1. The weekly content batch (Monday, 60 minutes)

1. Open the business Project. Paste last week's results (top 2 posts) and this week's news and offers.
2. Run the "weekly ideas" prompt: 10 ideas across pillars; choose 4.
3. Run the "caption + story" prompt for each; edit by hand.
4. Create visuals in Canva with your real photos; schedule in Meta Business Suite (Week 5).

2. The review reply routine (daily, 10 minutes)

Copy new reviews into the review-reply custom GPT or Gem, personalise each draft, publish from Google Business Profile or Tripadvisor.

3. The monthly report (first Monday, 45 minutes)

Export GA4, ads and email data as CSV; ask for calculations, charts and a 5-line summary; check the key numbers; paste into your Data Studio or slide report (Week 2).

4. The repurposing chain (once per pillar piece)

From one blog article or video transcript, ask for: 5 social posts, 1 email, 3 Reel scripts, 1 LinkedIn post, 5 FAQ answers (Week 4 repurposing).

5. Meeting and brief summaries

Paste notes or a transcript (without confidential details) and ask for decisions, actions, owners and deadlines.

From workflows to automation

When a workflow is stable, parts of it can be automated with tools like Zapier or Make (for example, every new review in a sheet triggers an AI draft reply for approval). Weeks 14 and 15 cover automation. Always keep a human approval step before anything is published or sent to customers.

SECTION 23

Working with AI as a team

When several people use AI on the same brand, quality can drift fast: different tones, different facts, and confidential data in personal accounts. A few simple rules keep everyone aligned.

Roles in an AI-assisted team

Role	Responsibilities
Owner of AI rules (owner or marketing lead)	Writes the AI use policy, chooses approved tools and plans, decides what needs approval
Prompt library keeper	Maintains the library and brand Projects, shares new prompts, removes outdated ones
Creators	Use approved prompts and Projects, add real material, do the first edit
Reviewer / approver	Applies the six-point quality check (Section 25) and approves publication
Everyone	Protects personal data, reports mistakes, shares what works

A one-page AI use policy

Even a small business should write down its AI rules. Keep it short and practical:

1. **Approved tools and accounts**: which assistants, on which plan (business accounts preferred), with which privacy settings.
2. **Data rules**: what can never be pasted (personal data, client documents, passwords, unpublished financials).
3. **Approval**: what needs a second person to approve (all public content, all ads, all customer emails).
4. **Disclosure**: when we label AI content (Section 27).
5. **Never**: fake reviews, fake testimonials, imitating real people, copying competitors, AI replies sent to customers without a human check.
6. **Records**: keep prompts and sources for important content (who made it, with which tool, who approved).

Working with clients and agencies

If you work for clients (as a freelancer or agency), agree in writing whether and how you use AI, especially with their confidential data. Many companies now require it in contracts. Use the client's approved tools when they have them.

> **In Mauritius:** the National AI Strategy 2025–2029 of Mauritius is accompanied by the FAIR guidelines introduced in April 2026 (Fairness, Accountability, Inclusiveness, Integrity and Responsibility). They are not a law and carry no penalties today, but they show what the government expects: no unfair bias, a clearly responsible person, AI that benefits everyone, and good data protection. They are a useful checklist for your own AI policy.

SECTION 24

Advanced prompting for better marketing outputs

Once you master C.A.R.E., these techniques help with harder tasks: long documents, consistent series, and outputs that go straight into your tools.

Prompt chaining

Split a big task into a chain of smaller prompts, each using the previous output. For a campaign: research → insights → concepts → chosen concept → messages → channel plan → content. Each step is easier to check and correct than one huge prompt.

Templates with placeholders

```
You are a copywriter for [BUSINESS], a [TYPE] in [TOWN], Mauritius.
Audience: [PERSONA]. Voice: [3 WORDS]. Offer: [OFFER + PRICE + DEADLINE].
Write [NUMBER] [FORMAT] for [PLATFORM]. Max [LENGTH]. End with [CTA].
Do not invent facts. Example of our style: [EXAMPLE].
```

Save templates like this in your library; fill the brackets each time.

Delimiters and labelled inputs

When you paste long material, separate it clearly from instructions using labels or quotes: "REVIEWS START" ... "REVIEWS END". The model then knows what is data and what is instruction. This also protects you against text inside documents that looks like instructions.

Rubrics and scoring

```
Score each of these 10 headlines from 1 to 5 on: clarity, relevance to
beginners, local feel, and policy safety. Return a table with total scores,
then rewrite the 3 lowest-scoring headlines.
```

Reverse prompting

Paste a great piece of content (yours or a well-known example) and ask: "Write the prompt that would produce this text." Then adapt the prompt for your own business. This is a quick way to grow your library.

Multimodal prompts

- Upload a photo of your shop window: "Suggest 5 improvements to make it more attractive on Instagram."
- Upload a screenshot of your landing page: "Review this page for a first-time visitor on mobile. List 5 issues by priority."
- Upload a competitor flyer: "What is their main promise, offer and target? How could we differentiate?"
- Record a voice note of your idea and ask for a structured brief.

> **Prompt injection:** web pages, emails or documents you paste may contain hidden instructions ("ignore previous instructions and..."). AI agents that browse the web or read your inbox can be tricked by them. Keep a human check before any action like sending emails, posting or paying, and use AI agents only on trusted accounts with limited permissions.

PART E

Quality, law and ethics

Fact-checking, originality, bias, copyright, data protection and honest disclosure

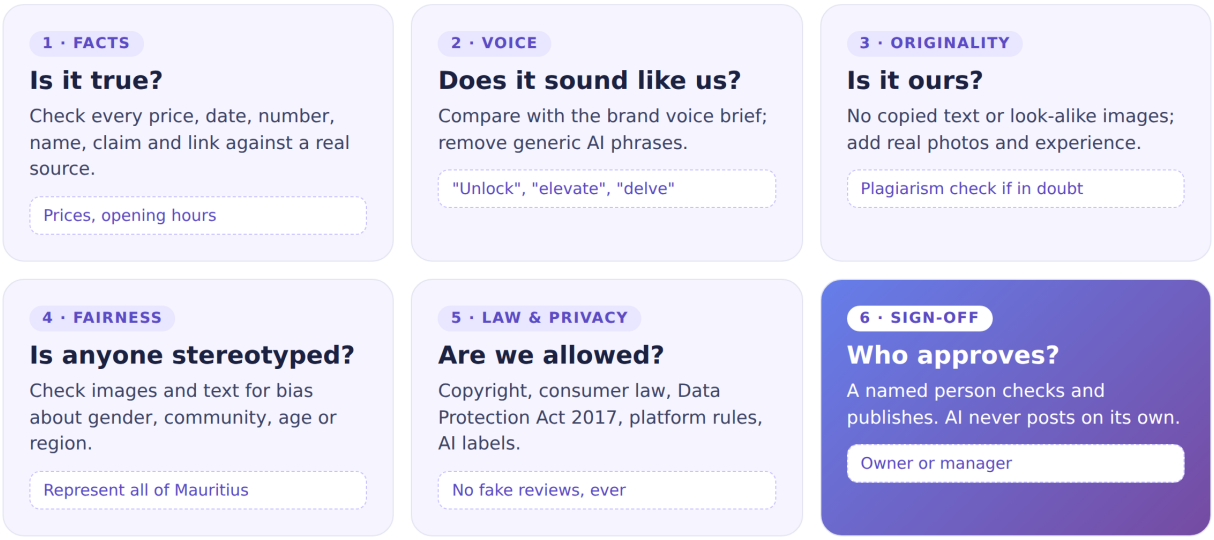

SECTION 25

Quality control: fact-checking, bias and originality

AI makes it easy to produce a lot of content. It also makes it easy to publish a lot of mistakes. A short, systematic quality check protects your reputation and saves you from embarrassing corrections.

The six-point quality check before anything AI-made goes live

Every piece, every time: a human signs it off

Fact-checking, step by step

1. **Highlight every fact** in the text: numbers, prices, dates, names, places, claims, quotes, links. You can ask the AI: "List every factual claim in this text in a table."
2. **Check each against a primary source**: your price list, the official website, the law, the original study. A blog quoting a statistic is not a primary source.
3. **Remove or rewrite** anything you cannot verify. "Many guests love our breakfast" is honest; "92% of guests" is not, unless you measured it.
4. **Click every link** and check it goes to the right page.
5. **Check dates and seasons**: festival dates (Divali, Cavadee, Eid) and public holidays change every year.

Originality and plagiarism

AI does not usually copy whole texts, but it can reproduce common phrases, well-known slogans or passages close to its training data, and image tools can produce images that look like existing artworks or brands.

- Add what only you have: your photos, data, customer stories, opinions and local knowledge. This is also what Google and AI search reward (E-E-A-T, Week 3).
- For important articles, run a plagiarism check (for example Grammarly’s plagiarism checker, Quetext or Copyscape) and search distinctive sentences in Google in quotation marks.
- Never ask for content "in the style of" a living artist or "like competitor X’s website".

- Do not rely on "AI detectors" to judge people’s work: they are unreliable and can wrongly accuse writers, especially non-native English speakers.

Bias and representation check

Check	Question to ask
People in images	Do the people reflect our real customers and the diversity of Mauritius (communities, ages, body types, abilities)?
Stereotypes	Are roles assigned by gender or community (only women cooking, only men in business)?
Language	Is the text accessible and respectful? Does it exclude people who are not fluent in English?
Assumptions	Does it assume everyone has a car, a credit card, a big budget or the same religion?

Brand voice check

Read the text aloud. Would your best salesperson say it to a customer? Remove AI clichés, check the words-to-avoid list from your brand brief, and make sure the call to action matches your real process (WhatsApp, booking link, phone).

> **Tip:** keep a simple "AI quality log": each time AI makes a mistake that reaches a draft (wrong price, invented fact), note it and add a rule to your Project instructions or prompt. Your prompts get safer over time.

SECTION 26

Copyright, confidentiality and data protection

This section gives practical guidance, not legal advice. When in doubt, especially for important campaigns or client work, ask a lawyer.

Copyright and AI-generated content

- **Who owns the output?** The terms of ChatGPT, Claude and Gemini generally let you use what you generate, including commercially. But whether AI-generated content is **protected** by copyright is uncertain in many countries.
- **Human authorship matters.** The US Copyright Office concluded in 2025 that prompts alone are not enough for copyright protection, but human selection, arrangement and modification of AI material, and human-written parts, can be protected. Copyright law in other countries, including Mauritius, has not clearly settled the question.
- **Practical consequence:** for logos, slogans and key brand assets, make sure a human creates or substantially changes them, so you can protect them. A purely AI-generated logo may be hard to defend.
- **Don’t infringe others’ rights:** don’t upload copyrighted images to transform them without permission, don’t generate images of real people or brand logos you don’t own, and use music licensed for business (Week 5).

Confidentiality

Anything you paste into an AI tool leaves your control: it is processed on the provider’s servers, often outside Mauritius, and on some plans it may be used to improve models. Treat AI chats like email to an outside company.

Safe to paste (generally)	Never paste into a personal AI account
Public information (your website, published posts)	Customer names, phone numbers, emails, addresses, ID numbers
Anonymised data ("Customer A", totals, averages)	Health, religious or other special category data
Your own draft texts and ideas	Client documents under NDA, contracts, pitches
Aggregated, non-personal campaign results	Passwords, API keys, bank details, unpublished financial results

The Mauritius Data Protection Act 2017

In Week 10 you saw how the Data Protection Act 2017 (DPA 2017) applies to email marketing. The same principles apply when personal data goes into AI tools:

DPA 2017 principle	What it means for AI use
Lawful, fair and transparent processing	You need a lawful basis to put customers’ personal data into an AI tool, and they should know how their data is used (privacy notice).
Purpose limitation and minimisation	Use only the data you need. To analyse reviews, remove names; to analyse sales, use totals.
Security (the controller is responsible)	Choose tools with proper security and business terms; control who has access.
Transfers outside Mauritius (section 36)	Most AI providers process data abroad. Transfers are only allowed with adequate safeguards or under specific conditions (such as consent).
Rights of data subjects	People can ask what data you hold and object to direct marketing; you must be able to answer.
Registration (section 14)	Businesses that process personal data must register with the Data Protection Office.

the simplest way to stay safe: **anonymise before you upload**. Replace names with codes, delete contact details, and work with totals. For tasks that truly need personal data (for example a CRM assistant), use a business plan with a data processing agreement and get advice.

SECTION 27

Ethics: disclosure, labelling and honesty

The question is not only "Is it legal?" but "Would our customers feel tricked if they knew?" Trust is the most valuable asset of a small business in a small market.

Platform rules on AI labels (October 2026)

Platform	Rule (summary)
TikTok	Realistic AI-generated or significantly edited content must be clearly labelled (TikTok's AI-generated label, a sticker or caption). AI likeness of private people, or of public figures for commercial endorsements, is not allowed.
YouTube	Creators must disclose realistic altered or synthetic content in YouTube Studio (for example a real person saying something they didn't, or a realistic scene that never happened). Not required for AI-assisted scripts, titles, thumbnails or captions, or minor edits like colour correction.
Meta (Facebook, Instagram, Threads)	Meta adds an "AI info" label when it detects AI content or when people disclose it, and asks users to disclose photorealistic video or realistic audio that was digitally created or altered.
Google Merchant Center	AI-generated product images need metadata, and AI-generated titles and descriptions must be labelled.

When to disclose AI use to customers

- **Always** label realistic AI images, video or voices of people, places or events, especially in ads.
- **Always** be clear when a customer is talking to a chatbot rather than a person.
- **Usually not needed** for AI help with spelling, ideas, outlines or first drafts that a human rewrites and checks, though you can mention it in an AI policy on your website.
- **If in doubt**, disclose. Hiding AI use and being discovered costs far more trust than a short label.

Red lines: never do this

Never	Why
Fake reviews or testimonials (AI-written or not)	Deceives customers; removed by Google, Tripadvisor and Meta; can lead to penalties and breaks consumer protection principles
AI images presented as your real product, room or result	Misleading advertising; angry customers when reality is different
Deepfakes or voice clones of real people without consent	Breaks platform rules and personal rights; reputational disaster
Fake "before/after" results	Misleading, and against health and beauty ad policies
Fake urgency or invented scarcity	Manipulative; damages trust
AI replies to complaints sent without reading them	Customers notice; a cold, wrong reply makes a crisis worse (Week 5)

> **The trust test:** before publishing, ask "If a customer found out exactly how we made this, would they still trust us?" If the answer is no, don't publish it.

PART F

Put it to work

A case study, your AI Prompt Toolkit, templates and checklists

SECTION 28

Case study: a cake shop works smarter with AI

"Lakaz Gato" is a fictional but realistic family cake shop in Rose Hill with 4 staff. The owner, Marie-Anne, did all the marketing herself in the evenings: about 8 hours a week for Instagram, Facebook, WhatsApp replies and a monthly email. She had tried ChatGPT, but "the posts sounded like a robot and it invented our prices".

1. The starting point

- Random prompts typed on her phone ("write a post about cakes"), different each time.
- Generic, enthusiastic captions with invented offers and 20 hashtags.
- Customer names and phone numbers pasted into a free AI account to "write thank-you messages".
- No time left to film videos or reply quickly to WhatsApp orders.

2. What she set up in two weeks

Step	Action
Privacy	Switched off model training in settings; deleted chats with customer data; new rule: no personal data in AI
Brand voice brief	One page built with AI from her 5 best posts (Section 10), checked by her daughter
Project	A "Lakaz Gato" Project with the brief, price list, delivery zones, FAQ and festival calendar
Prompt library	18 tested prompts in a Google Sheet: weekly ideas, captions, Reel scripts, review replies, email, FR translation, ad headlines
Workflows	Monday 60-minute content batch; daily 10-minute review and DM routine; monthly CSV report
Quality check	The six-point check printed next to the computer; her daughter approves anything in French or Kreol

3. The Divali campaign strategy

Using the campaign workflow (Section 15), she wrote a one-page brief and asked Claude and ChatGPT for three concepts. She chose "One box, every family" around the Rs 650 Lumière box, and asked the AI to challenge it as a sceptical accountant. The plan was cut from 7 channels to 4: Instagram, Facebook, WhatsApp status and broadcast to opted-in customers, and a small Meta Ads budget of Rs 8,000.

4. Results after 3 months (illustrative)

Measure	Before	After 3 months
Hours a week on marketing	8	4.5
Posts and Reels a week	2	4
Average WhatsApp reply time	3 hours	40 minutes
Instagram reach per month	9,500	21,000
Divali boxes sold	140 (previous year)	260
Factual errors published	3 (wrong prices)	0

What made the difference: not a better tool, but better inputs (brief, facts, examples), saved prompts, and a human check. The time saved went into what AI cannot do: filming Marie-Anne decorating cakes and talking to customers.

> **The lesson:** AI multiplies what you give it. Generic inputs give generic content; a clear brief, real facts and a fixed review routine give content that sounds like you, in half the time.

SECTION 29

Exercises and your AI Prompt Toolkit

Your Week 13 deliverable is an **AI Prompt Toolkit**: an AI-generated campaign strategy document, 5 sample marketing outputs and a personal library of tested prompts. Work on a real business: your own, your employer's or one you know well.

Exercise A · Compare three assistants (45 min)

Create free accounts on ChatGPT, Claude and Gemini and check privacy settings (Section 6). Run the same 3 C.A.R.E. prompts (a caption, a 5-question FAQ, a summary of 20 reviews) in all three. Score each answer from 1 to 5 for accuracy, voice and usefulness, and note which you prefer for each task.

Exercise B · Brand voice brief and Project (45 min)

Write a one-page brand voice brief using the 8-part structure in Section 10, with AI help. Create a Project, custom GPT or Gem with the brief and key facts (Section 11). Test it with 3 tasks.

Exercise C · AI campaign strategy (90 min)

Follow Section 15: write a brief, ask for 3 concepts, choose one, develop the 8-part strategy document, then challenge it with at least 2 critical prompts. Keep the prompts you used.

Exercise D · Five sample marketing outputs (60 min)

Create 5 outputs for the campaign, each from a different category: for example a social caption set, a Reel script, an email, 15 Google Ads headlines with 4 descriptions, and a blog outline or a French translation. Apply the six-point quality check (Section 25) and show the before (AI draft) and after (your final version).

Deliverable: the AI Prompt Toolkit

Part	Content
1. Business and tools	Business summary; assistants used and why; privacy settings checked
2. Brand voice brief	One page (Section 10)
3. AI campaign strategy document	8-part strategy (Section 15) with the key prompts used
4. Five sample outputs	Draft and final version of each, with the prompt and tool used
5. Prompt library	At least 15 tested prompts in 5+ categories, using the template on the next page (Google Sheet or Notion)
6. Quality and ethics	Your quality checklist, an AI use policy (Section 23), and 3 lessons learned

Submit the toolkit (Google Doc or PDF link, 8–12 pages) and the link to your prompt library on the learning platform, Module 13 exercises.

TEMPLATES

Copy-and-use templates

C.A.R.E. prompt template

```
CONTEXT: You are [ROLE] for [BUSINESS], a [TYPE OF BUSINESS] in [TOWN], Mauritius.
Audience: [PERSONA]. Voice: [3 WORDS + "we are / we are not"].
Facts to use: [PRODUCT, PRICE, DATES, CONTACT]. Situation: [WHY NOW].
ACTION: [VERB] [WHAT] for [CHANNEL].
RESULT: [NUMBER] options, max [LENGTH], in [LANGUAGE], format [TABLE/LIST/TEXT].
Include: [MUST-HAVES]. Avoid: [MUST-AVOID]. Do not invent facts; ask if unsure.
EXAMPLE: [PASTE A PIECE YOU LIKE]
```

Brand voice brief (one page)

Part	Your content
Who we are	
Audience	
Voice in 3 words (is / is not)	
Language and spelling	
Words we use / avoid	
Key facts	
Rules	
Examples (links)	

Quality check log

Output	Tool	Facts checked	Voice	Original	Bias	Legal / label	Approved by

SECTION 30

Checklists and glossary

AI set-up checklist

- ☐ Free accounts on 2–3 assistants; privacy and training settings checked
- ☐ Brand voice brief written and checked by a human
- ☐ Project, custom GPT or Gem with the brief and key facts
- ☐ Prompt library started with tested prompts and placeholders
- ☐ Weekly content workflow and review routine in the diary
- ☐ Six-point quality check agreed; approver named
- ☐ One-page AI use policy shared with the team
- ☐ Rule: no personal or confidential data in personal AI accounts
- ☐ Platform AI labelling rules understood (TikTok, YouTube, Meta)
- ☐ Monthly AI visibility prompt test (Week 3) scheduled

Mistakes to avoid

Mistake	Do this instead
One-line prompts	C.A.R.E. with facts and an example
Publishing the first draft	Iterate, then edit by hand
Trusting AI statistics	Check the source or remove the number
Pasting customer data	Anonymise first; use business plans
AI photos of products that don’t exist	Real photos of real products
Fake reviews or testimonials	Ask real customers for reviews
Everyone prompting differently	Shared Projects and a prompt library
Unchecked Kreol or French	Fluent human review
Letting AI publish or reply alone	A named human approves everything

Glossary

Term	Meaning
AI (Artificial Intelligence)	Computer systems doing tasks that normally need human intelligence
Machine learning (ML)	AI that learns patterns from data to make predictions
Deep learning	Machine learning using large, many-layered neural networks
Generative AI	AI that creates new text, images, audio or video
LLM (large language model)	A generative AI model trained on huge amounts of text, such as the models behind ChatGPT, Claude and Gemini
Prompt	The instruction and information you give to an AI
Token	A small piece of text (part of a word) that a model reads and writes
Context window	Everything the model can take into account at once in a conversation
Knowledge cut-off	The date after which the model’s training data stops
Hallucination	A confident but false or invented answer
C.A.R.E.	Context, Action, Result, Example: the trainer’s prompting framework
Few-shot prompting	Giving a few examples so the AI follows the pattern
Prompt chaining	Splitting a task into a sequence of prompts
Project / custom GPT / Gem	Saved workspaces or assistants with your instructions and files
Deep Research	Assistant mode that searches many sources and writes a report
Multimodal	Able to work with text, images, audio and video
AI agent	An AI that carries out multi-step tasks using tools, such as browsing or sending emails
Performance Max	Google Ads campaign type using AI across all Google channels from one campaign
AI Max for Search	Google Ads option adding AI matching, text and landing page choice to Search campaigns
GEO	Generative Engine Optimisation: being mentioned and cited by AI assistants (Week 3)
Prompt injection	Hidden instructions in content that try to manipulate an AI
